## 1

# The SuperReport Pro Interface

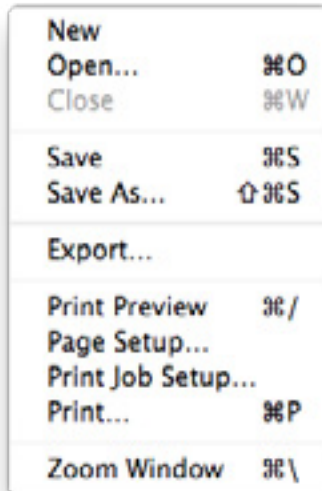

Following is a detailed description of the SuperReportPro interface.

The interface comprises a [menu bar](#), [toolbar](#), and [report design area](#):

# The Menu Bar

## File Menu

**New:** Create a new report.

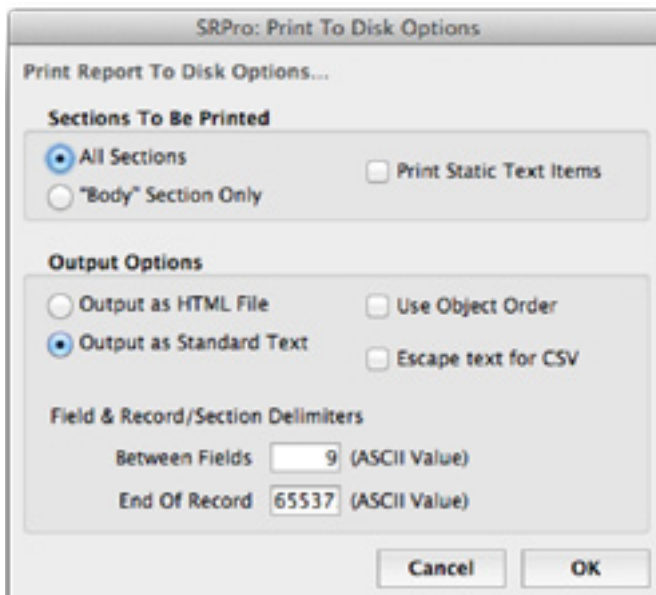

**Open ... :** Open a report that has previously been saved to a file.

**Close:** Close the current report definition.

**Save:** Save the current report definition.

**Save As ...:** Save the current report definition as a new file.

**Export ...:** This option enables you to export the report to an HTML or plain text file:

**Print Preview:** Create a preview of the report in PDF format. On MacOS: open it in the Preview application. On Windows: the default is to use the Microsoft XPS Document Writer, but it can be programmatically changed to use SuperReport Pro's internal PDF creator (see "Print Flags" in the [SuperReport Pro Developer Manual](#)).

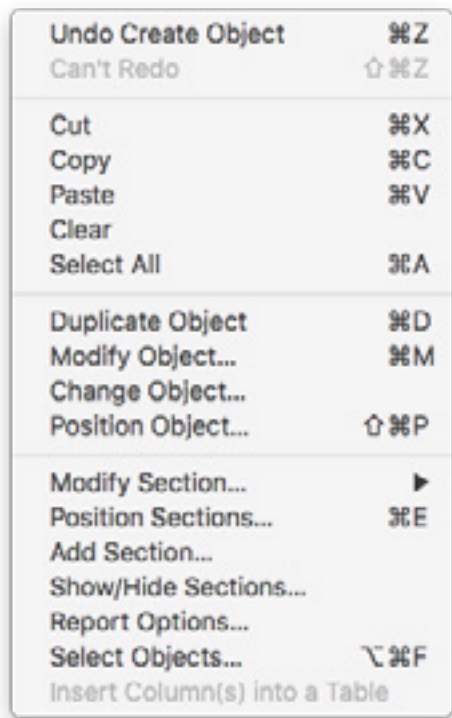

**Page Setup:** Open the standard Page Setup dialog.

**Print Job Setup:** Open the standard Print Setup dialog.

**Print:** Print the report.

**Zoom Window:** Open an external window to display the report, on top of the 4D form (which remains open). The report can be edited in either window.

## Edit Menu

**Undo ...:** Undo the last change you made.

**Cut, Copy, Paste, Clear, Select All:** The usual functions.

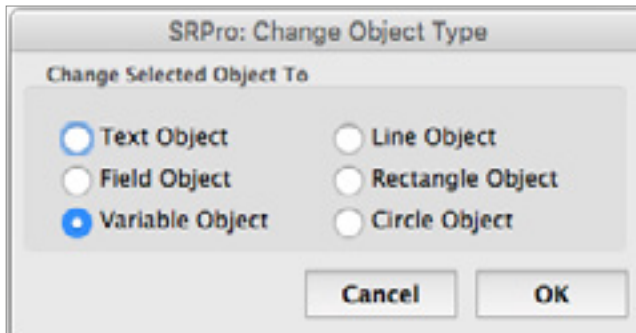

**Duplicate Object:** Duplicate the selected object or objects.

**Modify Object:** This has the same effect as double-clicking the selected object:

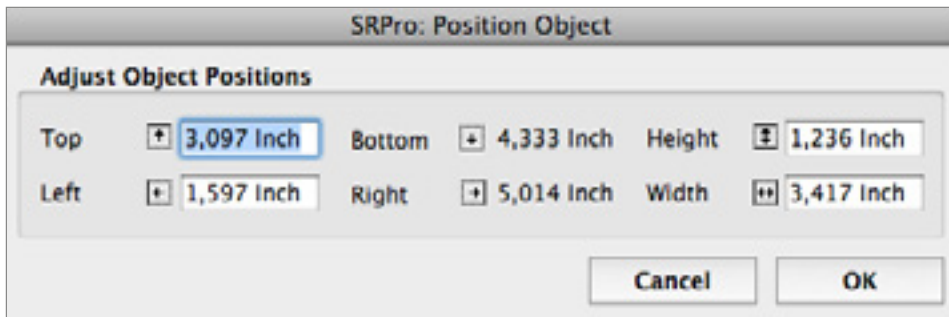

If no objects are selected, it opens the Report Properties dialog

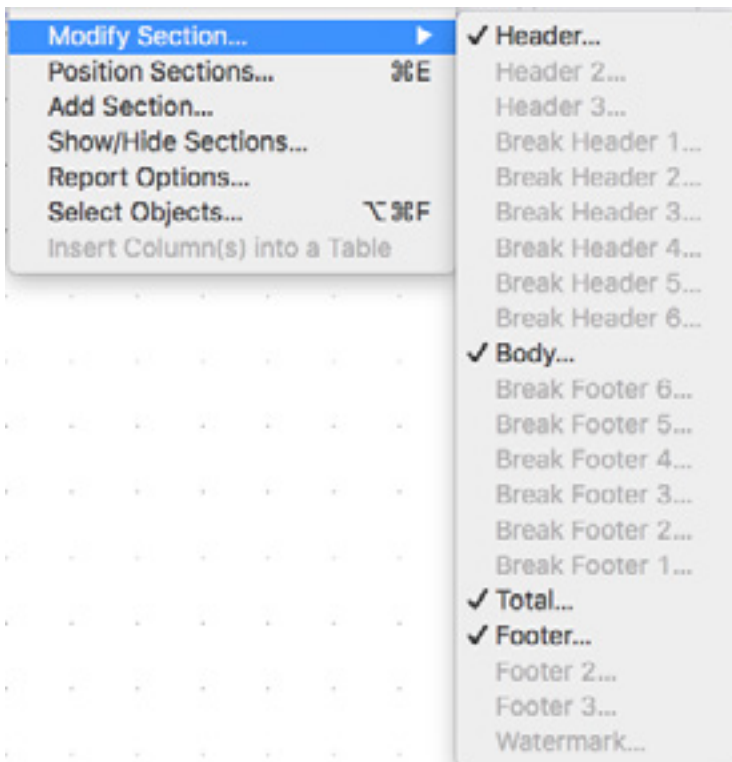

**Change Object:** Change the selected object type:

**Position Object:** This option allows you to specify precise coordinates for the selected object:

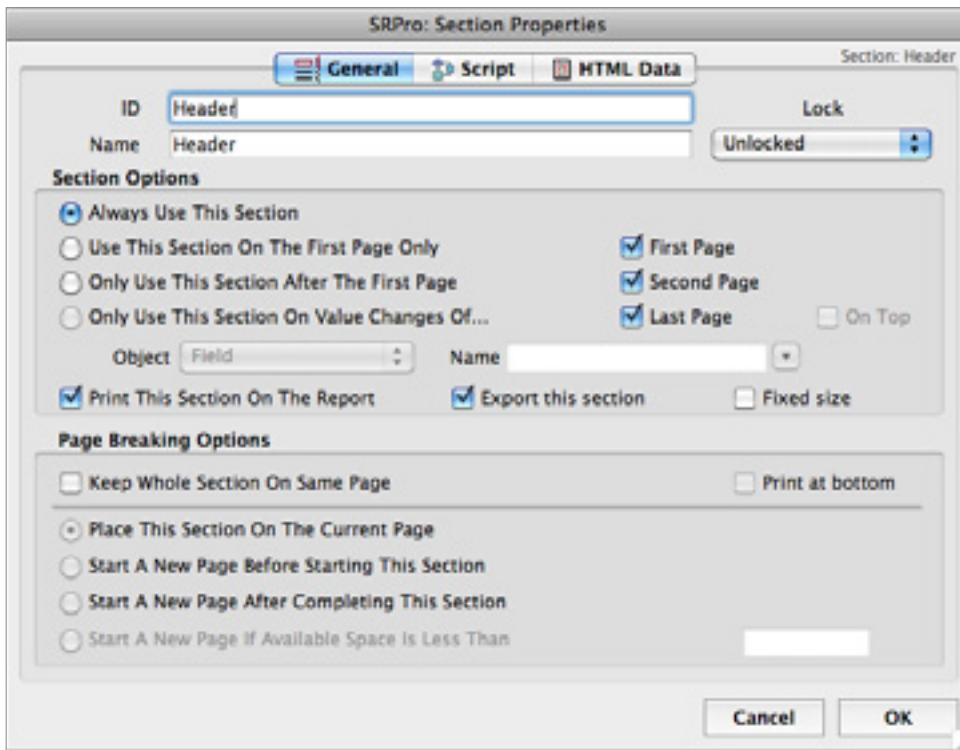

**Modify Section:** Edit the settings for the selected section. This option offers a flyout menu which lets you choose the Section you want to modify:

You can modify various properties of the selected section:

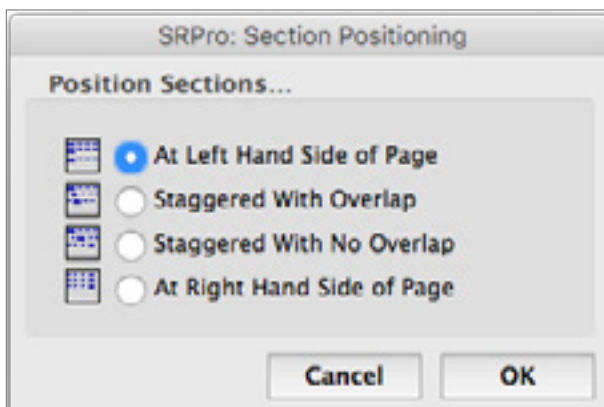

The **ID** and **Name** fields can be useful in XML and HTML exports - for example, use ID as class-id for formatting.

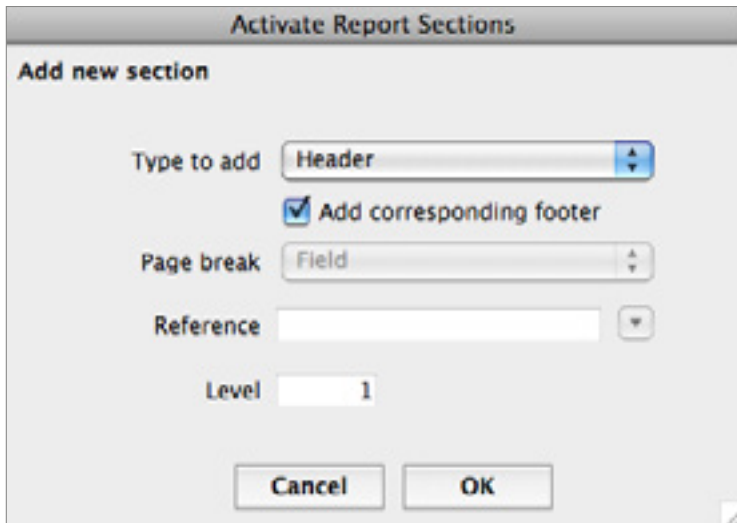

**Lock:** Choose from three options:

- Unlocked - the section can be modified in any way by the user.
- Locked (selectable) - **object** can be selected (and then modified using **Edit->Modify Object** or double-click), but it can't be moved using the mouse.
- Locked (selectable) **section** can be selected (and then modified using **Modify Object** or double-click), but its objects can't be selected or modified in the user interface.
- Fully locked (not selectable) - The object/selection cannot be selected (although any object can be selected using **Edit->Select Objects**).

**Position Sections:** This sets the horizontal positioning of section markers:

**Add Section:** This will display the Section management dialog, allowing you to add report sections, which are used for creating break processing reports, and also for adding a Watermark section.

Activate Report Sections

Add new section

Type to add: Header

Add corresponding footer

Page break: Field

Reference: [ ]

Level: 1

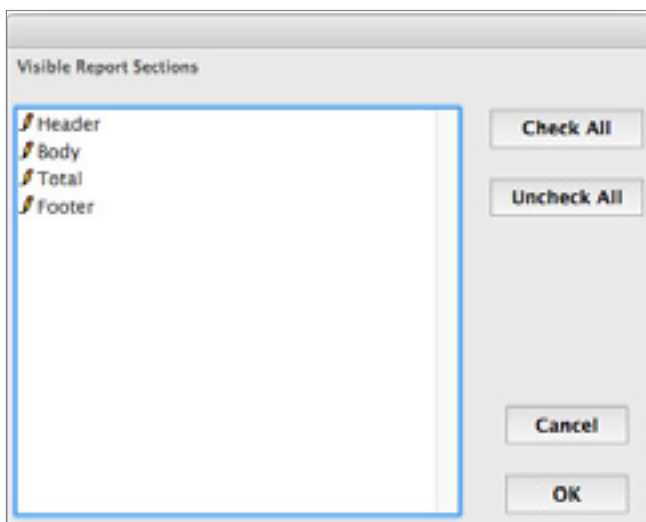

Cancel OK

A Watermark section can be added to your report. This allows you to print a watermark on the report. The watermark is editable only when it is shown on top or no other section is visible.

- When it is on top, objects from other sections are not selectable by mouse.
- When it is on the bottom, objects from the watermark section are not selectable by mouse.

For more information about adding sections, see the [Create a break processing report](#) topic in the [Tutorial section](#).

**Show/Hide Sections:** Selects which sections will be visible in the report:

Visible Report Sections

Header

Body

Total

Footer

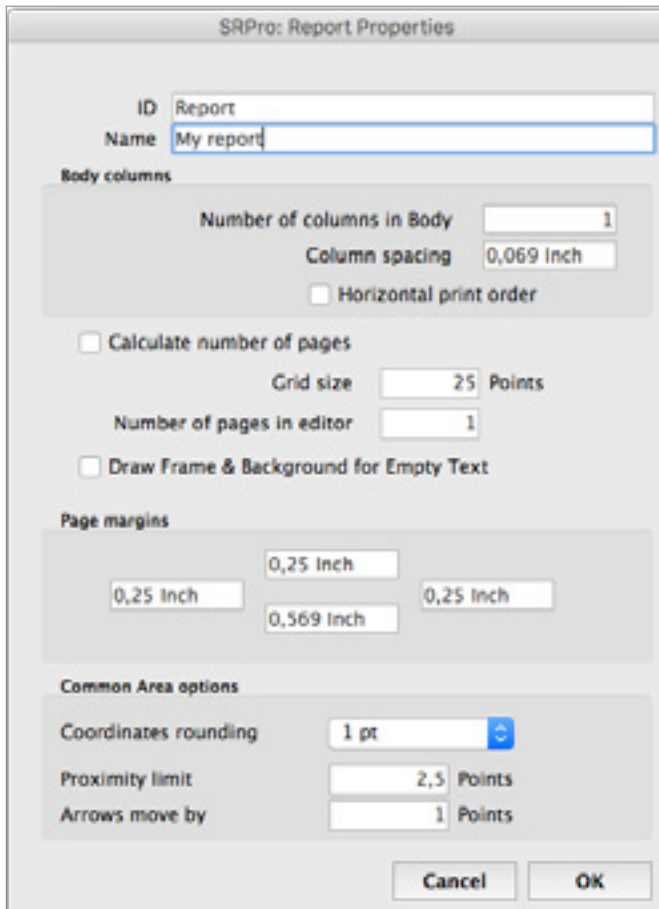

Check All

Uncheck All

Cancel

OK

**Report Options:** Sets the general Report properties:

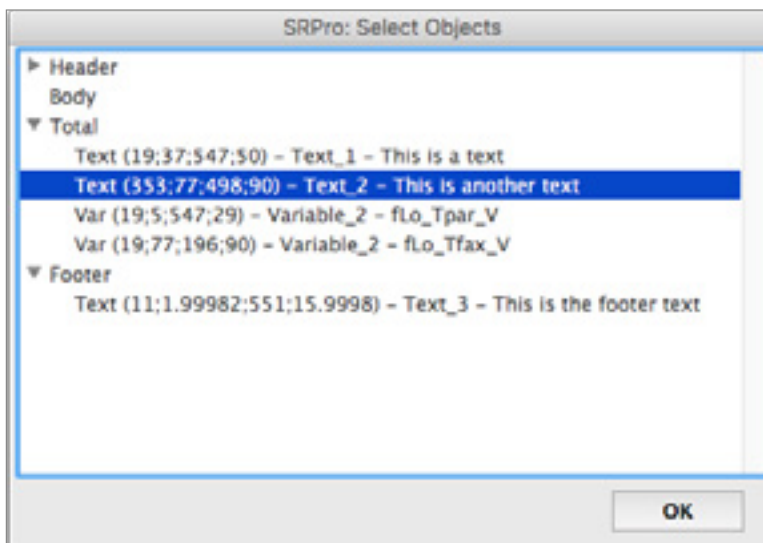

The dialog box 'SRPro: Report Properties' contains the following fields and options:

- ID: Report
- Name: My report
- Body columns:
  - Number of columns in Body: 1
  - Column spacing: 0,069 Inch
  - Horizontal print order
- Calculate number of pages
  - Grid size: 25 Points
  - Number of pages in editor: 1
- Draw Frame & Background for Empty Text
- Page margins:
  - Top: 0,25 Inch
  - Bottom: 0,25 Inch
  - Left: 0,25 Inch
  - Right: 0,569 Inch
- Common Area options:
  - Coordinates rounding: 1 pt
  - Proximity limit: 2,5 Points
  - Arrows move by: 1 Points

Buttons: Cancel, OK

**Select Objects:** Displays a dialog to select one object from a hierarchical list of all report objects grouped into sections:

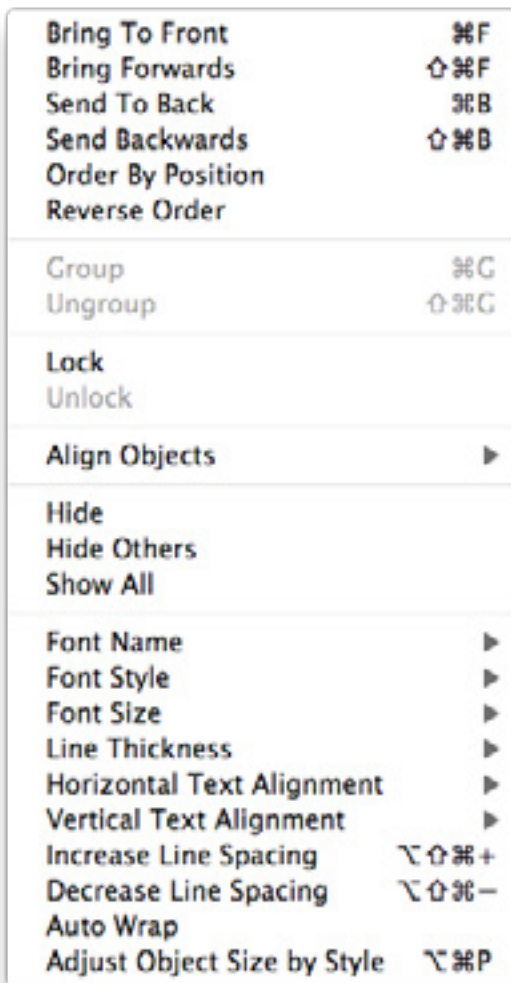

The dialog box 'SRPro: Select Objects' displays a hierarchical list of report objects:

- Header
- Body
- Total
  - Text (19;37;547;50) - Text\_1 - This is a text
  - Text (353;77;498;90) - Text\_2 - This is another text** (highlighted)
  - Var (19;5;547;29) - Variable\_2 - flo\_Tpar\_V
  - Var (19;77;196;90) - Variable\_2 - flo\_Tfax\_V
- Footer
  - Text (11;1.99982;551;15.9998) - Text\_3 - This is the footer text

Button: OK

**Insert Column(s) into a Table:** Available when a Table object header, column or footer is selected. Inserts a column at the left of the selected object. If several contiguous objects are selected, the same number of columns is inserted.

## Object Menu

The options under the Object menu enable you to manipulate selected objects in various ways.

**Bring To Front:** Make the selected object(s) the frontmost.

**Bring Forwards:** Bring the selected object(s) up one level.

**Send to Back:** Move the selected object(s) behind all other objects.

**Send Backwards:** Move the selected object(s) down one level.

**Order By Position:** Re-order the selected objects by the top/left position.

**Reverse Order:** Re-order the selected objects in reverse order.

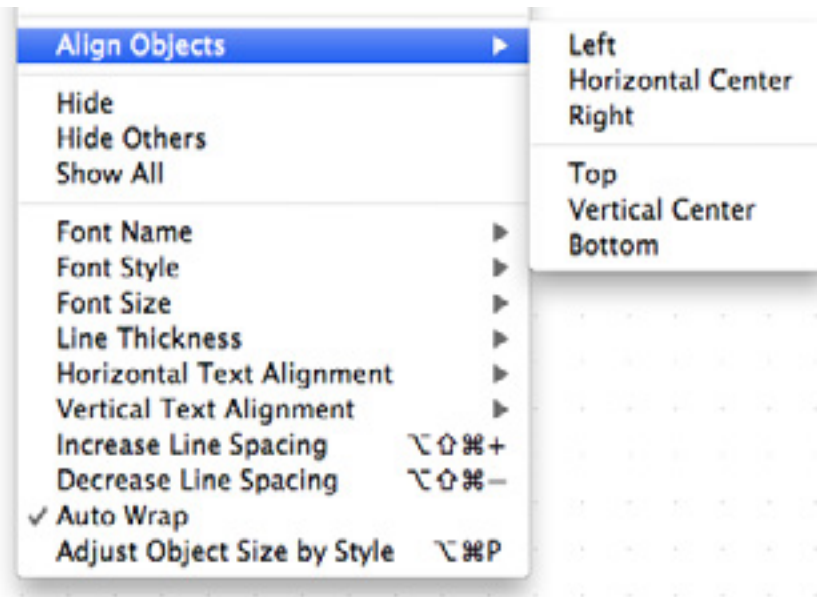

**Group:** Group the selected objects together.

**Ungroup:** Ungroup the selected objects.

**Lock:** Lock the selected object(s) so that they cannot be accidentally moved.

**Unlock:** Unlock the selected object(s) so that they can be moved.

**Align Objects:** Align the selected objects as specified:

**Hide:** The selected object(s) will not be visible on the report. Note that making an object invisible has nothing to do with printing - this property is used only in the editor.

**Hide Others:** Hide all objects except the selected ones.

**Show All:** Un-hide all objects.

**Font Name:** Choose a font for the text of the object(s).

**Font Style:** Choose a style (Plain, Bold Italic, Underline) for the text of the selected object(s).

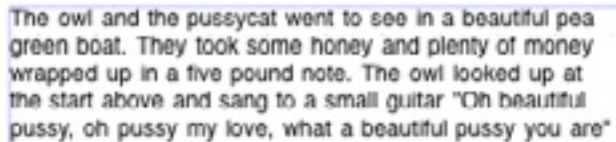

**Font Size:** Choose a size for the text of the selected object(s). Size increase and decrease submenu items step by one point.

**Line Thickness:** Choose a width for a selected line item.

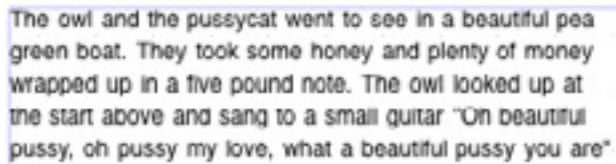

**Horizontal Text Alignment:** Choose the alignment for the text of the selected object(s) - Default, Left, Centered, Right, Justified, Fully Justified).

**Vertical Text Alignment:** Choose the vertical alignment of the text within its text box (Default, Top, Center, Bottom).

**Increase Line Spacing:** Increase the spacing (leading) between the lines of the selected text object(s). For example, an object with the default line spacing set might look like this:

A screenshot of a text box containing the following text: "The owl and the pussycat went to see in a beautiful pea green boat. They took some honey and plenty of money wrapped up in a five pound note. The owl looked up at the start above and sang to a small guitar "Oh beautiful pussy, oh pussy my love, what a beautiful pussy you are". The text is displayed with a standard, default line spacing.

Increase the spacing once and it would then look like this:

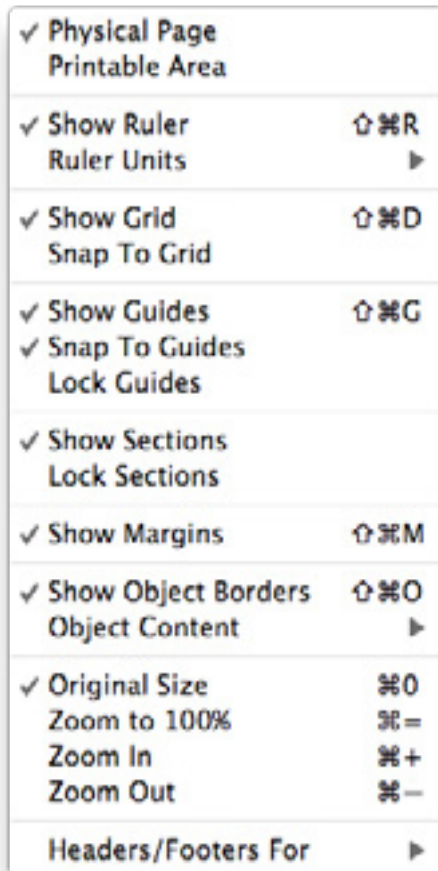

A screenshot of the same text box as above, but with the line spacing increased. The lines of text are now more widely spaced, making the text appear more open and less dense.

**Decrease Line Spacing:** Decrease the spacing between the lines of the selected text object(s).

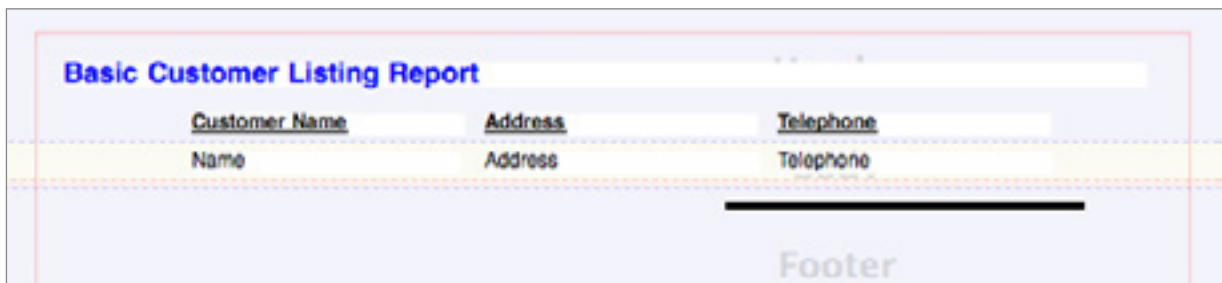

**Auto Wrap:** Automatically wrap the text within the selected object(s).

**Adjust Object Size by Style:** Automatically adjust the height of the object according to the contents and the font size and style selected for the object. Note that this does not compute the "best object size" - it computes the nearest multiple of a full line height. For example, if you have 6 lines of text and the object shows 1.25 lines, it will shrink the object to 1 line. However, when the text is multistyled (attributed), the full height is used, because every line could have a different height.

## View Menu

**Physical Page/Printable Area:** If **Physical Page** is selected, the report design area represents a printed page, with the non-printing margins shown. The printable area is bounded by a dotted red line if the **Show Margins** options is also selected:

If **Printable Area** is selected, the report design area will show only the actual printable area of the report, without the page margins.

**Show Ruler:** If Show Ruler is selected, the vertical and horizontal rulers will be displayed; if it is not selected, they will be hidden.

**Ruler Units:** Select the unit of measurement for the rulers (Point, Millimeter, or Inch).

**Show Grid:** Display the grid as dots in the background. If you can't see them, zoom in.

**Snap to Grid:** When moving objects, "snap" them to the grid.

**Show Guides:** Show any Guides that you have placed on the form. They appear as green lines:

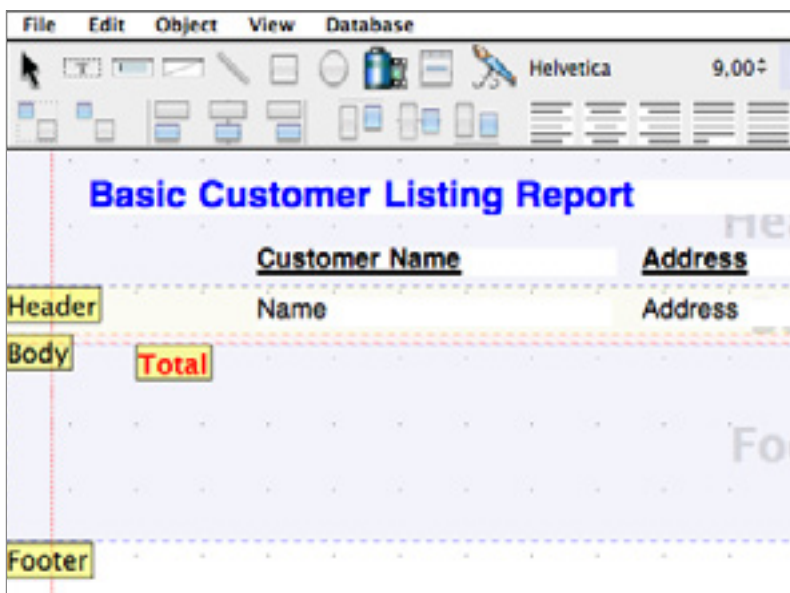

In this example, we've set a horizontal guide at 250 Pt and a vertical guide at 500 Pt. To set a guide, click on the edge of the horizontal or vertical ruler so that the cursor turns into a little pointer  and drag up or to the left.

**Snap to Guides:** When moving objects, "snap" them to the Guides you've created.

**Lock Guides:** Lock your guides into position so that they cannot be moved.

**Show Sections:** If Show Sections is selected, the section names are displayed in a yellow box:

**Lock Sections:** If Lock Sections is selected, the sections cannot be moved.

**Show Margins:** Show/hide the page margins.

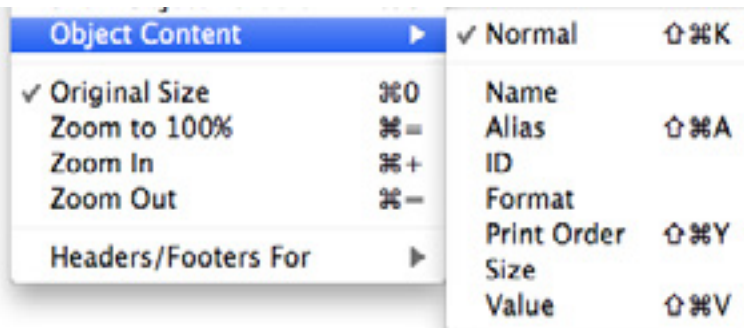

**Show Object Borders:** If this option is selected, the borders of the objects in the report are displayed - e.g.:

If this option is not selected, the objects are displayed without their borders - e.g.:

**Object Content:** This is a very useful option which enables you to instantly see various information about all the objects on the report:

The following table illustrates the various options:

| Option         | Example   |              |               |                |                  |
|----------------|---|--------------|---------------|----------------|------------------|
| Normal         | <table border="1"> <tr> <td>Total</td> <td>Payment Terms</td> </tr> <tr> <td>[Invoice]Total</td> <td>[Invoice]PayDays</td> </tr> </table> | Total        | Payment Terms | [Invoice]Total | [Invoice]PayDays |
| Total          | Payment Terms   |              |               |                |                  |
| [Invoice]Total | [Invoice]PayDays  |              |               |                |                  |
| Name           | <table border="1"> <tr> <td>Text_3</td> <td>Text_2</td> </tr> <tr> <td>[Invoice]Total</td> <td>[Invoice]PayDays</td> </tr> </table>       | Text_3       | Text_2        | [Invoice]Total | [Invoice]PayDays |
| Text_3         | Text_2  |              |               |                |                  |
| [Invoice]Total | [Invoice]PayDays  |              |               |                |                  |
| Alias          | <table border="1"> <tr> <td>Total</td> <td>Payment Terms</td> </tr> <tr> <td>Total</td> <td>PayDays</td> </tr> </table>                   | Total        | Payment Terms | Total          | PayDays          |
| Total          | Payment Terms   |              |               |                |                  |
| Total          | PayDays   |              |               |                |                  |
| ID             | <table border="1"> <tr> <td>object_00018</td> <td>object_00019</td> </tr> <tr> <td>object_00015</td> <td>object_00016</td> </tr> </table> | object_00018 | object_00019  | object_00015   | object_00016     |
| object_00018   | object_00019  |              |               |                |                  |
| object_00015   | object_00016  |              |               |                |                  |
| Format         | <table border="1"> <tr> <td>Text_3</td> <td>Text_2</td> </tr> <tr> <td>###,##0.00</td> <td>Within ##0 Days</td> </tr> </table>            | Text_3       | Text_2        | ###,##0.00     | Within ##0 Days  |
| Text_3         | Text_2  |              |               |                |                  |
| ###,##0.00     | Within ##0 Days   |              |               |                |                  |
| Print Order    | <table border="1"> <tr> <td>2</td> <td>1</td> </tr> <tr> <td>1</td> <td>2</td> </tr> </table>   | 2            | 1             | 1              | 2                |
| 2              | 1   |              |               |                |                  |
| 1              | 2   |              |               |                |                  |
| Size           | <table border="1"> <tr> <td>65,11</td> <td>101,11</td> </tr> <tr> <td>64,11</td> <td>103,11</td> </tr> </table>                           | 65,11        | 101,11        | 64,11          | 103,11           |
| 65,11          | 101,11  |              |               |                |                  |
| 64,11          | 103,11  |              |               |                |                  |
| Value          | <table border="1"> <tr> <td>Total</td> <td>Payment Terms</td> </tr> <tr> <td>2000,16</td> <td>Within 30 Days</td> </tr> </table>          | Total        | Payment Terms | 2000,16        | Within 30 Days   |
| Total          | Payment Terms   |              |               |                |                  |
| 2000,16        | Within 30 Days  |              |               |                |                  |

**Original Size:** Show the report at the zoom level that it was originally created in.

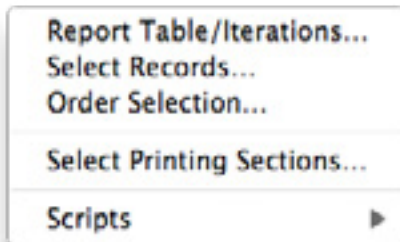

**Zoom to 100%:** Show the report at its actual printing size.

**Zoom In/Zoom Out:** Zoom into or kout of the report - make it bigger or smaller on the screen.

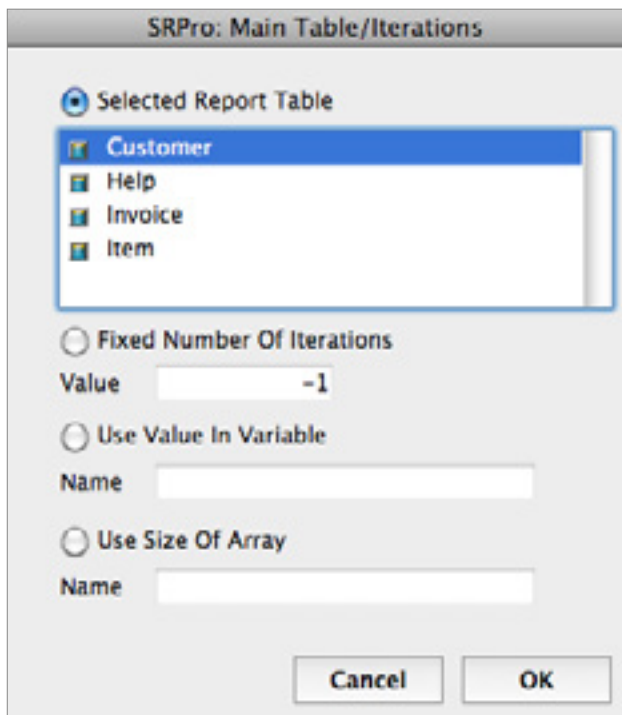

**Headers/Footers For:** Select which pages you want the header and footer areas to print:

## Database Menu

**Report Table/Iterations:** Display the Report/Table Iterations definition dialog, where you can set the main table for your report or how the number of iterations should be calculated in a repeating report:

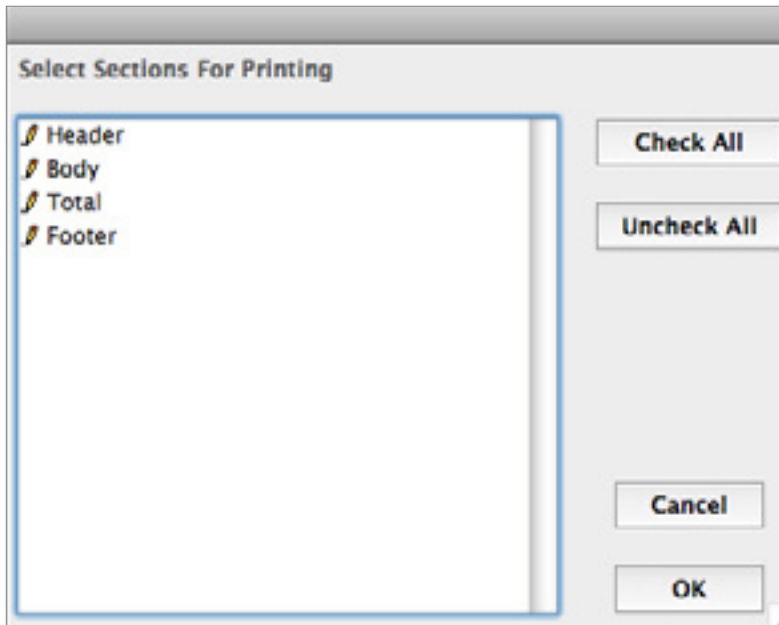

- **Selected Report table:** Choose a table for the report to be based upon. The number of iterations will be determined by the selected number of records being printed.
- **Fixed Number of Iterations:** Enter a number to specify how many iterations will be printed.
- **Use Value in Variable:** Enter the name of a numeric variable which will contain the required number of iterations.
- **Use Size of Array:** Enter the name of an array; the number of iterations will be determined by the number of elements in the array.

**Select Records:** Open the standard 4D Query Editor.

**Order Selection:** Open the standard 4D Order By dialog.

**Select Printing Sections:** Open a dialog which enables you to specify which sections will be printed:

All sections are selected for printing by default. An unselected section is shown in this way:

**Scripts:** You can write scripts to run during different events in the report execution cycle:

For an example of using scripts, see the [Tutorial](#).

# The Toolbar

The Toolbar offers many options for designing and configuring your reports:

## First Row

 **Selection Tool:** Use this tool to select a specific report object to work with.

Note: to select one or several object(s) without dragging a box around the whole object(s) hold down the Alt/Option key while drag-selecting. All "touched" objects will be selected.

 **Text Tool:** Create a static text object.

 **Field Tool:** Create a field object.

 **Variable Tool:** Create a variable object.

 **Line Tool:** Create a line object.

 **Box Tool:** Create a box object. Hold down the Shift key as you draw the object to create a square.

 **Circle Tool:** Create an oval or circular object. Hold down the Shift key as you draw the object to create a circle. When an Oval object is drawn, it initially appears as a rectangle. The actual shape can be seen when you have applied a line thickness and/or color, or fill color, to the object - for example:

The rectangle that you see is the object border.

Turn off **View >Show Object Borders** and you will see nothing unless the object is selected; once it is selected, you will see the frame and the resize handles.

When you open a new SuperReport Pro area, the default for both frame and fill is **off**, line thickness is 1 pt.

(view set to Show object ID)

You must change the frame/fill settings and possibly colors and thickness.

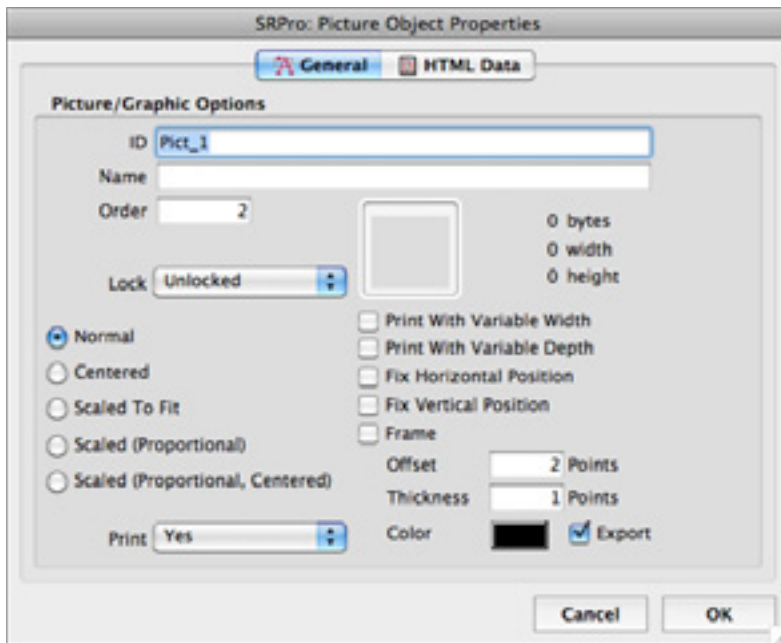

If you do it before the object creation (no object selected), it will be set as default. Then you will see the ellipse/circle during object creation.

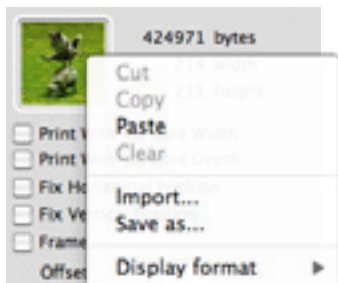

(view set to Normal)

**Picture Tool:** Insert a picture and modify its properties. To insert a picture, either paste one from the clipboard or select the Picture tool and draw a box. If you pasted the picture, double-click on it to open the Picture Object Properties window; if you drew a box, the Object Properties window will open automatically:

To select an image, right-click/Ctrl-click on the square image box. A contextual menu pops up:

Choose **Paste** to paste an image from the clipboard. Choose **Import ...** to open the file picker dialog to select an image file. The selected image will then be shown in the image box:

You can also drag and drop a picture onto the image box. Use the sizing options to determine how the image will be displayed within the box:

- Normal
- Centered
- Scaled To Fit
- Scaled (Proportional)
- Scaled (Proportional, Centered)

**Table Tool:** Insert a table. The Table dialog will open:

SRPro: Table Object Properties

Options Script HTML Data

ID Table\_1 Visible  Lock Unlocked

Name  Export  Print Yes

Order 1

Fix Horizontal Position

Fix Vertical Position

Number of Columns 4

Draw Headers

Number of Header rows 1

Draw Data Rows

Draw Nothing if Empty

Draw Footers

Number of Footer rows 0

Variable Row Height

Style Default

**Frame & Grid**

No

Offset 2 Points

Thickness 1 Points

Color  

Horizontal Grid Thickness 0,5 Points

Vertical Grid Thickness 0,5 Points

Row Height 0 Pt

Draw table with the fixed size set in the report

Cancel OK

## ■ Options Tab

**ID:** You can change the default ID for the table if you want to.

**Name:** You can enter a name for the table.

**Order:** The order in which the object will be processed when the report is printed.

**Fix Horizontal Position:** If this option is selected, the object will always be printed in the same position (horizontally). Otherwise, its position may change, depending on the other objects being printed.

**Fix Vertical Position:** If this option is selected, the object will always be printed in the same position (vertically). Otherwise, its position may change, depending on the other objects being printed.

**Number of Header rows:** Usually you will want one header row, but you can create more by increasing this number.

**Draw Headers:** If this option is not selected, the table will be printed without any headers.

**Number of Columns:** Enter the number of columns you want in your table. You will be able to specify the contents of the columns in the next step.

**Draw Data Columns:** If this option is not selected, no data will be printed in the table. Why would you want to print a table with no data? You can use this feature to create a static table (no data rows) consisting of the header only with variable substitution in the header cells. It will resize the cells as needed and draw a nice table, with the ability to split over pages both horizontally and vertically.

**Variable Row Height:** If this option is selected, the height of each row will automatically adjust to allow for the row's contents.

**Style:** Select a stylesheet.

**Visible:** If this option is not selected, the table will not be visible on the report.

**Export:** If this option is selected, the table will be included in a text or HTML export of the report.

**Lock:** See the [Lock options](#) description earlier in this chapter.

**Print:** Four options are available:

- No: The table will not be printed.
- Yes: Print once (this means it will be printed even On Overflow if the object had not yet been printed).
- On Overflow: This option is for when a section is split across page boundaries. For example, you could create a text object "Continued ..." at the top of a section and choose the On Overflow option. It will then print only after the section is split.
- Always: Always print.

**Frame:** Choose No, Single, or Double.

- **Offset:** The text inset within the cells, in points for both row and column dividers. The maximum is 20.
- **Thickness:** The frame thickness, in points.
- **Color:** The frame color.

Note: when the table frame is **None**, column and row dividers are not drawn and the Offset is not used! If you want to have row or column dividers (or both), set the frame to Single and frame thickness to 0. If you don't want any lines, set the frame to **Single** and all thicknesses to 0 to be able to use Offset as spacing between columns and rows.

**Horizontal grid thickness:** Width of the horizontal grid lines, in points. Enter 0 for no horizontal grid lines. The maximum is 20.

**Vertical grid thickness:** Width of the vertical grid lines in points. Enter 0 for no vertical grid lines. The maximum is 20.

**Row Height:** If you want to specify a row height, enter the value here. 0 means automatic.

## ■ Script

You can write a script to execute when the table is printed. This must be correct 4D syntax. Note the following information, which is specific to tables:

The script is run when lower-execution-level columns fetch a new row to allow SuperReport Pro to prepare the selection for this execution level. In other words, the script is not meant to be executed on every row, but as a query to get the column's data.

If you need to preprocess the values, use arrays.

When the section is fetched for execution, the section's script is run and then the scripts of all objects (in print order) are run. The table's column scripts are executed as part of the Table's script execution (to fetch data).

For the body section, the breaks are checked and the respective break headers/footers are executed and printed.

Note that you can also attach scripts to individual columns (see below).

## ■ HTML Data

On this tab you can enter HTML code - this will be executed when the report is printed to HTML.

For example:

```
<%tBegTagHTML%>  
<table border=1 width=100%>
```

The `<%tBegTagHTML%>` section tells SuperReport Pro to insert the contents of the variable `tBegTagHTML` when this report is printed in HTML format.

The next line will create a standard HTML table to display the data.

The following example shows a table that has been set up with 4 columns, a single-line border in blue at 1 point, and row and columns dividers of 0.5 pt:

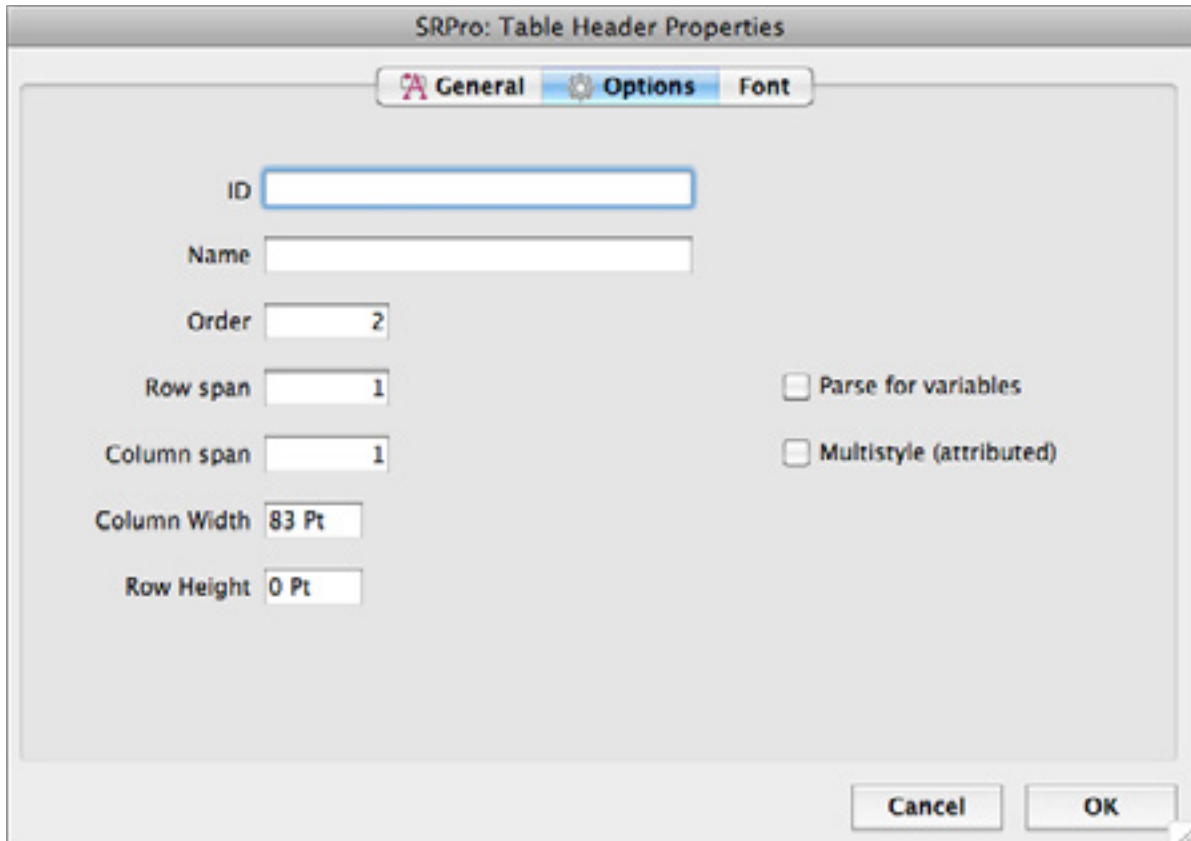

| Header_1,1 | Header_1,2 | Header_1,3 | Header_1,4 |
|------------|------------|------------|------------|
| Column_1   | Column_2   | Column_3   | Column_4   |
|            |            |            |            |

## ■ Modifying the Table

**Adjusting** column widths: Move your mouse pointer to the header dividing line and move it horizontally to resize a column (like a spreadsheet).

**Headers:** Double-click on a header to modify its text, set various Options, and choose the font and style.

### Header Properties

The image shows a dialog box titled "SRPro: Table Header Properties". It has three tabs: "General" (selected), "Options", and "Font". The "General" tab contains the following fields and options:

- ID: [Empty text box]
- Name: [Empty text box]
- Order: [Spin box with value 2]
- Row span: [Spin box with value 1]
- Column span: [Spin box with value 1]
- Column Width: [Text box with value 83 Pt]
- Row Height: [Text box with value 0 Pt]
- Parse for variables
- Multistyle (attributed)

At the bottom right, there are "Cancel" and "OK" buttons.

**ID:** You can enter an ID if you wish.

**Name:** You can supply a name for the header object.

**Order:** the column order.

**Row Span:** If you want the data in the selected column to span more than 1 row, enter the number of rows here.

**Column span:** to make the header span more than 1 column, enter the number of columns here.

**Column Width:** If you prefer to enter a precise width (in points) instead of manually resizing the column, enter the value here.

**Row Height:** Leave this value at the default (0) for automatic height adjustment. Or enter a value for a specific row height.

**Parse for variables:** You can embed variable references the same way as in Text objects (the table header is virtually a Text object). For example:

"This is an embedded <%variable%>"

The full syntax for text substitution can be found in the [SuperReport Pro Developer Reference](#) (see "Dynamic text").

**Multistyle (attributed):** Allow styled text within the header. See the [Styled \(attributed\) text](#) section.

## Column Properties

Double-click on a column body to edit its properties:

No Example Available

Cancel OK

**ID:** You can assign an ID to the column.

**Name:** You can assign a name to the column.

**Order:** The column display and print order.

**Styles Popup Tool:** You can create custom text stylesheets. To create a stylesheet, click on the Styles tool and choose **Edit Styles ...** :

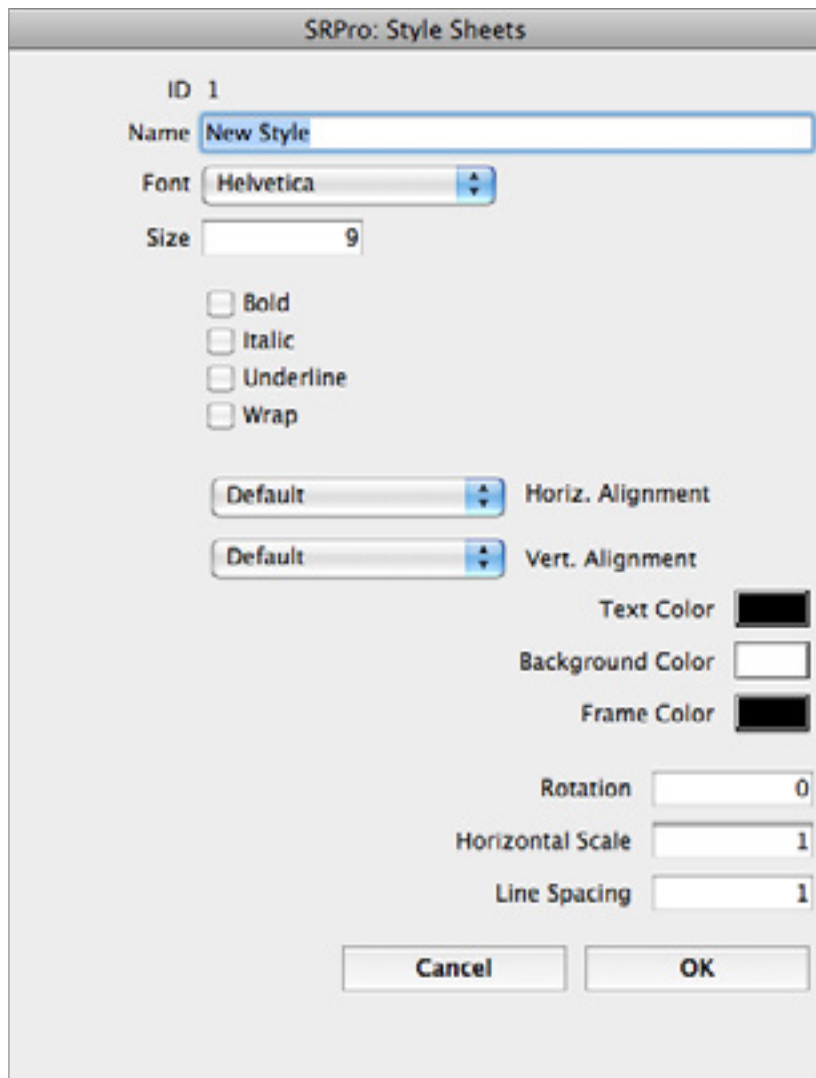

SRPro: Style Sheets

---

**Edit Style Sheets**

| Style Name | ID |
|------------|----|
| Default    | 0  |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |
|            |    |

Click the **New Style** button to create a new stylesheet. Then double-click the new style to change its name and other properties:

The image shows a dialog box titled "SRPro: Style Sheets". It contains the following fields and controls:

- ID 1
- Name:
- Font:
- Size:
- Bold
- Italic
- Underline
- Wrap
- Horiz. Alignment:
- Vert. Alignment:
- Text Color:
- Background Color:
- Frame Color:
- Rotation:
- Horizontal Scale:
- Line Spacing:
- Buttons:

 **Font Size Popup Tool:** Assign the selected font size to the selected object(s).

**Use Line/Frame Color tool:** Click to apply the selected line width and color to the selected object.

**Line/Frame Color Tool:** Open the color picker to choose a color to apply to the selected object or text. Click to select the line or frame color; option-click to select the font color.

**Line Width Tool:** Select the thickness of a line or frame.

## Second Row

**Group Tool:** Group the selected objects together.

**Ungroup Tool:** Ungroup the selected grouped objects.

**Object Alignment Tools:** When you have two or more objects selected, you can align them using these tools.

**Text Alignment Tools:** You can align and justify text, field, or variable objects using these tools.

**Use Fill Color Tool:** Apply the selected fill color from the Fill/Background Color Tool to the selected object(s).

**Fill/Background Color Tool:** Open the color picker for you to select a fill/background color. Apply the selected color to an object with the **Use Fill Color Tool**.

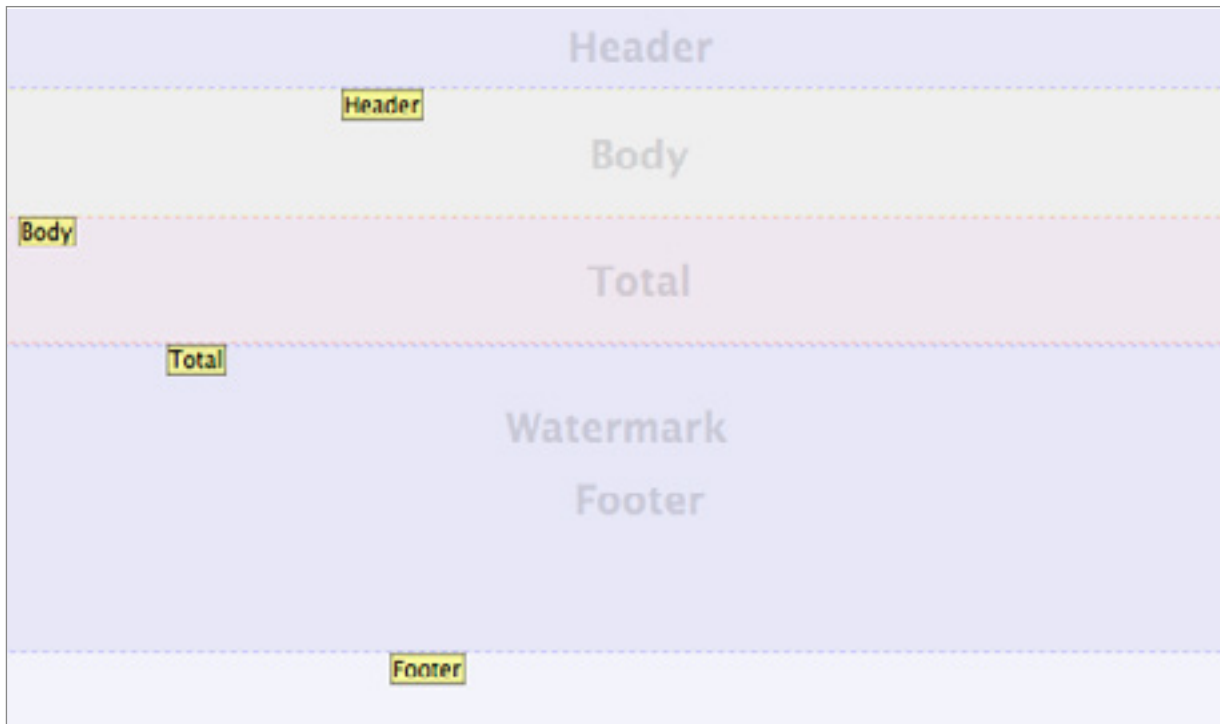

## Object Defaults

When a new object is created, the default values are used – not the currently displayed options. To change default value, use the respective tool to change them while there is no object selected. For example, to make the default line thickness and color for new objects such as rectangles and ovals 1 point, blue:

- Make sure no objects are selected on the report.
- Click on the Line width tool and select 1 pt.
- Click on the Line/Frame Color tool and select blue.
- Draw the required object.

# The Report Design Area

## Section Marker Overview

SuperReport Pro provides the ability to create a variety of report types. When creating reports, you will need to adjust the Section markers to support the style of reports you wish to create. There are five different section markers available when creating reports.

### ■ Header

The header section is printed once for each page. Typically, you will display report tiles, field titles, etc. in the Header section.

### ■ Body

The body section is the primary section used by SuperReport Pro. This is where you will place the actual field or variable objects which you wish to have appear on your reports. If you are creating a break-processing report (we cover this in a bit), you can also place field or variable objects in the additional break sections.

### ■ Total

The total section is where you will place report totals. If you are creating break-processing reports, you can also use the SubTotal sections to provide total information.

## ■ Footer

The footer section is printed once for each page. Typically, you will display report date and time information, or page numbers.

## ■ Watermark

A Watermark section is not included by default. To add one, choose **Add Section ...** from the **Edit** menu.

# Grids and Guides

When you are placing objects on the form, you can use Grids and Guides to help align all the objects nicely.

## ■ Grid

To show the grid, select **Show Grid** from the **View** menu. The grid is displayed as small dots - if they are too small to see, try zooming in! Choose **Snap to Grid** from the **View** menu to make objects snap smartly into line when they are moved.

## ■ Guides

You can create Guides to help you line objects up horizontally or vertically when you want to set precise positions. To create a Guide, click on the edge of the horizontal or vertical rule so that the pointer turns into a guide symbol:

Then drag the pointer up or left to position the guide.

Guides appear as light green lines:

If you can't see them, zoom in.

Choose **Snap to Guides** from the **View** menu to activate the guides.

## Resizing Sections

You can resize any section by moving the bottom section separator line up or down.

### ■ Resize cursor

When you click on such a line or its marker label the cursor becomes “vertical resize”:

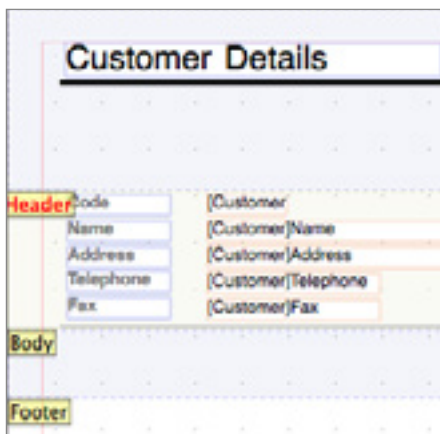

### ■ Example

Moving the line or the marker up or down will shrink or expand the section above it.

Here is a header before resize:

Moving the separator line down increases its height:

### ■ Effect on other sections and objects

Note that the sections and objects below the modified section will visually move up or down.

This has no effect on these section sizes or object placements. Since the sections are displayed one above the other, this movement only means: “Some section(s) above have been resized”.

## ■ Separators vs markers

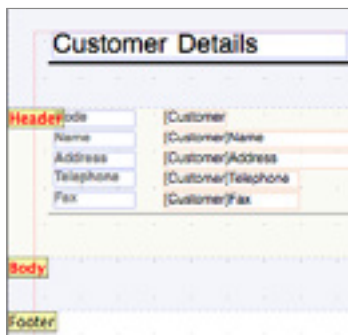

A separator line can only be moved up or down. A marker can either do the same (with the same effect), or be moved horizontally for display convenience in the SuperReport Pro editor:

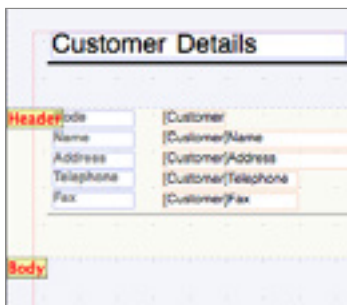

## ■ Modifier keys

You can resize several sections at once using the shift key.

- click on a section (or marker)
  - shift-click on another section (or marker)
- two sections are selected:

- now click on the marker of one of the selected sections and move it
- both selected sections will be resized:

Also, during the drag of the marker(s):

- shift key will limit the horizontal movement of the marker(s)
- option key will limit the vertical movement of the marker(s) - section(s) will not be resized

## ■ Difference with previous versions

If you move a SuperReport Pro section marker, all section markers under the selected marker will move accordingly.

SuperReport Pro version 2 used only “lines” to define the start of a new section (similar to 4D form editor).

SuperReport Pro version 3 **always** moves all sections, because the sections are containers of objects and one of them is being resized - all other (not selected) sections are moved.

When moving a section label, hold down the Option key to move only the label horizontally (not to resize the section); hold down the Shift key to resize the section (not to move the label horizontally).

## Table objects

Several tools and shortcuts are available for Table objects.

### Insert Column(s) into Table (Edit menu item)

- The selection can be any of header cell(s), column(s), footer cell(s) of exactly one Table object (then the menu item is enabled)
- When multiple cells are selected, it will insert number of columns defined by the range (last selected column - first selected column) before the first selected column (defined not by the order the selection was made, but by the column order)
- When no column is selected, it will append 1 column

### Move Table column(s)

- Alt/option left/right arrow will move the selected column(s) including headers/footers to the left/right
- The column must be selected (does not work for header/footer cells)
- Because the move is made on per-object basis, selecting two adjacent columns and using alt-right-arrow will do nothing: the first one is moved to the right (after the second one), then the second one is moved to the right (being now the second one again)

### Delete Table column(s): DEL (or Edit > Clear menu item)

The column must be selected (does not work for header/footer cells)

## Object overflow

When an object overflows to the next section, a small red triangle is drawn to indicate that a possible problem may result:

# Tutorial - Introduction to the SuperReport Pro Editor

This section provides an overview of the various editor components and how they can be used to create reports. We will cover the following points:

- [Menu Overview](#)
  - [Creating a basic listing report](#)
  - [Creating a basic form report](#)
  - [Using Repeating Objects](#)
  - [Creating a basic break processing report](#)
  - [Creating an HTML report](#)
  - [Printing Arrays](#)
-

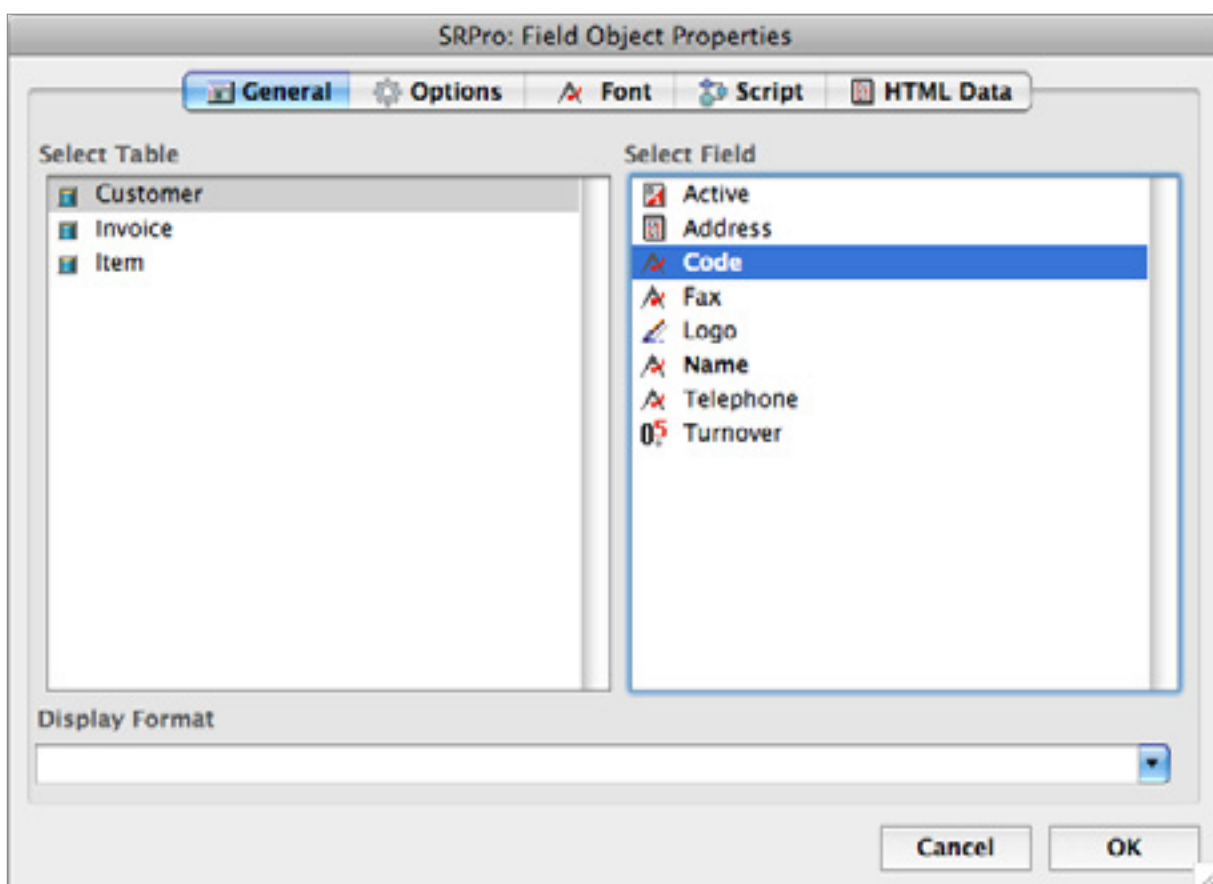

# Menu Overview

SuperReport Pro provides a variety of menus and menu items which can be used to further customize your reports. We'll introduce you to a few of the most commonly used menu items.

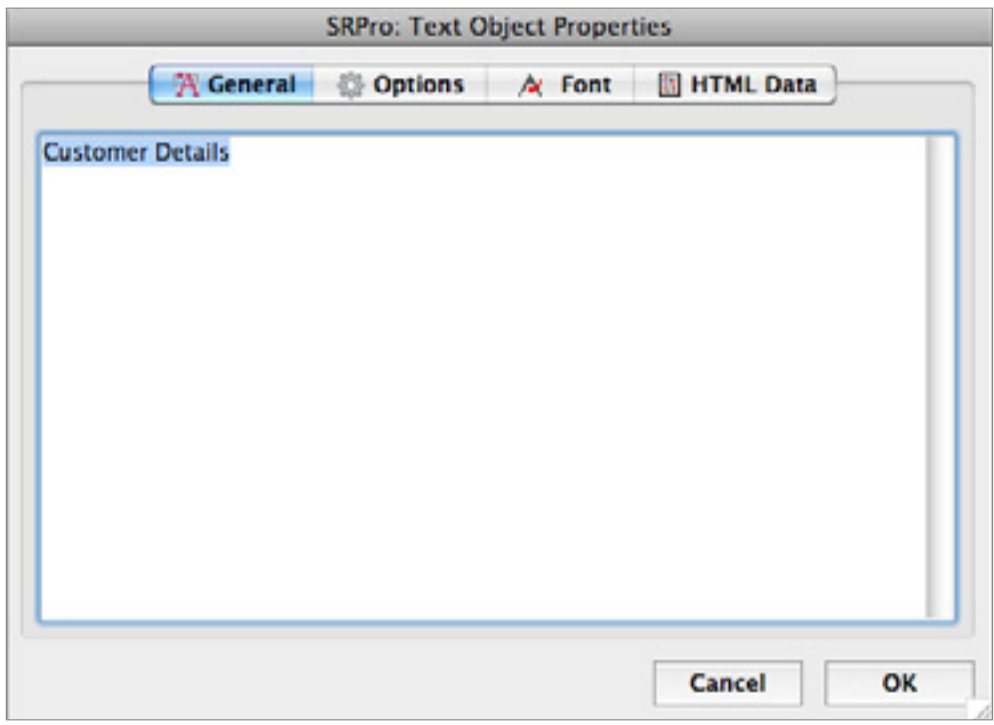

## Edit | Modify Object

(Also displayed when you double-click on a report object)

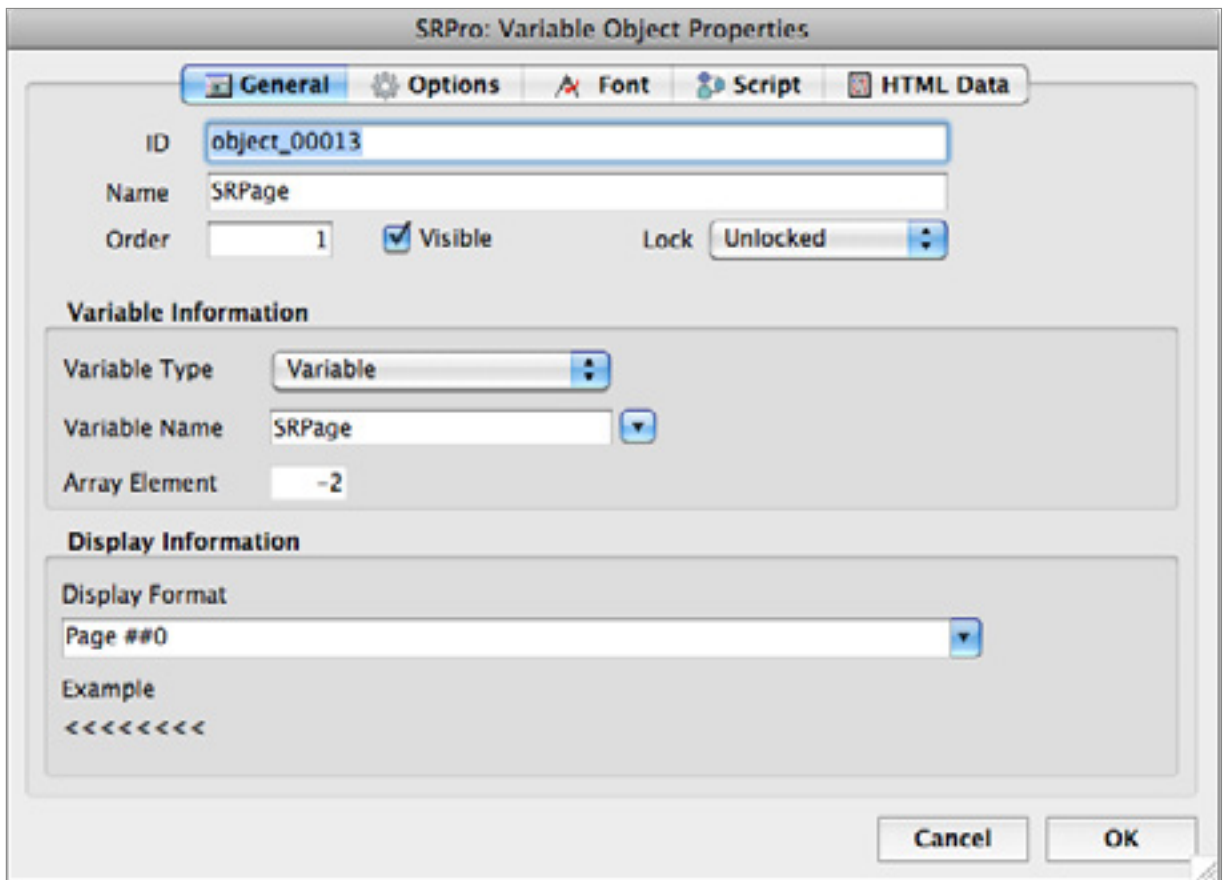

This item will display the various object definition dialogs. Depending on the type of object you have selected, the corresponding dialog will be displayed.

SuperReport Pro Field Object Dialog

SuperReport Pro Static Text Object Dialog

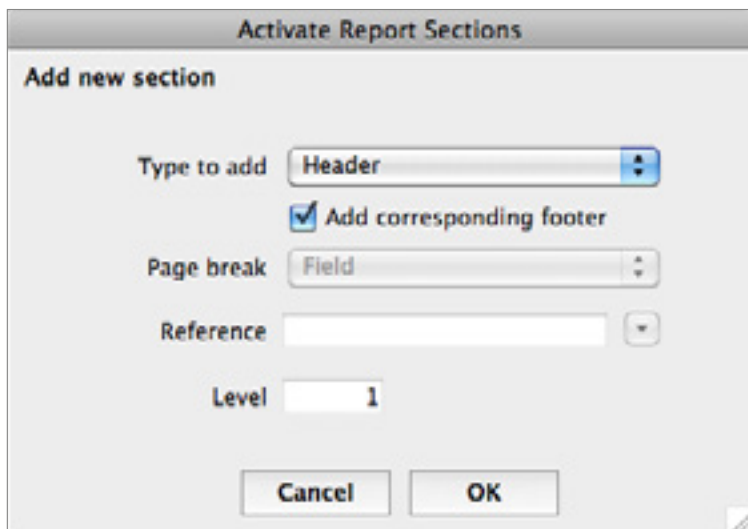

SuperReport Pro Variable Object Dialog

## Edit | Add Section

This item will display the Section management dialog, allowing you to add report sections, which are used for creating break processing reports.

The screenshot shows a dialog box titled "Activate Report Sections" with a subtitle "Add new section". The dialog contains the following elements:

- "Type to add": A dropdown menu with "Header" selected.
- "Add corresponding footer": A checked checkbox.
- "Page break": A dropdown menu with "Field" selected.
- "Reference": An empty text input field with a dropdown arrow.
- "Level": A text input field containing the number "1".
- Buttons: "Cancel" and "OK" buttons at the bottom.

SuperReport Pro Add Section Configuration Dialog

## Database | Select Records

This item will display the standard 4<sup>th</sup> Dimension Query Editor that will allow you to locate the records which you wish to include in the report. If you don't perform any record selection, the current selection will always be printed.

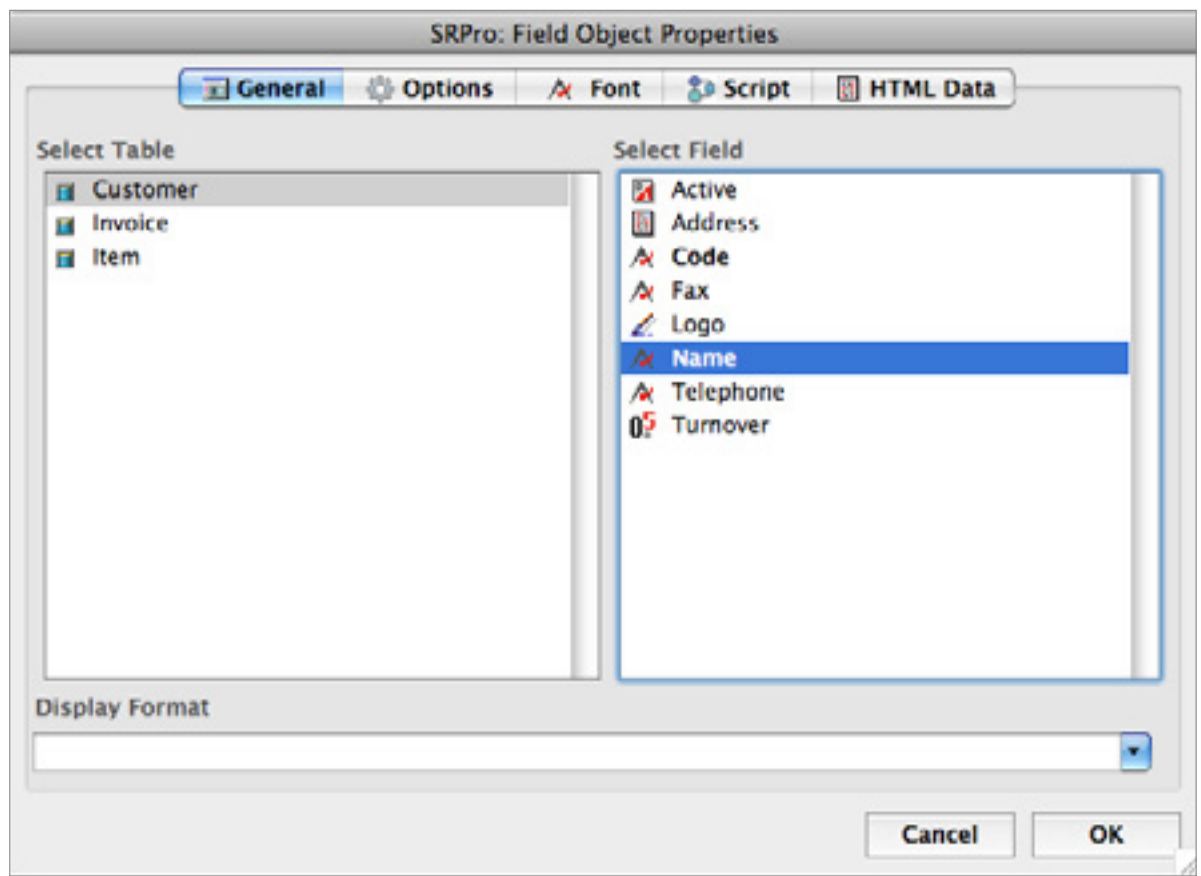

## File | Print Preview

This item allows you to preview the report before it is printed.

# Creating a Basic Listing Report

Now that you have had an overview of the SuperReport Pro toolbar, section markers, and basic menus, you are ready to begin creating your first report.

1. Add a new field to the report area. Each of the items should be placed in the Body section (above the Body marker). Select the Field Tool, then draw a box in the location where you would like the field located. The Field Object Properties dialog opens:

Select the field that you would like to place on the report for the new object.

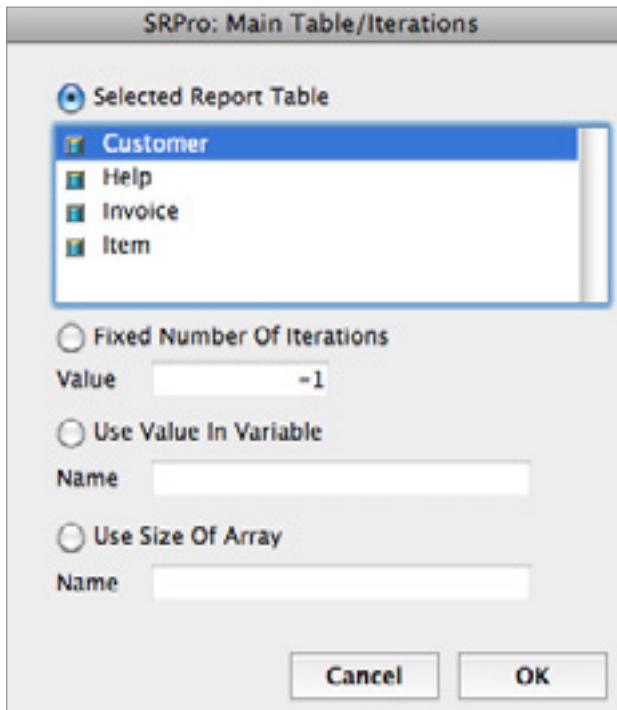

2. Repeat Step 1 to add a couple more fields (e.g. Customer Code and Telephone). Your report should look something like the following:

3. Now, we'll add the corresponding field titles. Using the Text Tool, create field titles for each of the fields you've added. While you are here, go ahead and apply some additional font formatting, such as making the titles bold. After you have completed adding the titles, your report should look something like the following:

4. The next step is to set the Main Table for this report. For this example we'll select the Customer table. Select **Report Table/Iterations** from the **Database** menu. The Report/File Iterations dialog will be displayed.

SuperReport Pro Table Selector Dialog

5. We're just about done. The last thing we need to do is establish a selection of records for the selected file. Choose **Select Records** from the **Database** menu. The standard 4<sup>th</sup> Dimension Query Editor will be displayed, which will allow you to perform any query you wish to establish the record selection.
6. You should now save your report before continuing. Click the form's **Save** button (which will in turn, execute the Save code we created in the Using Plug-In Area section).
7. Return to the record we just created by double clicking it from the report table output form. If you have successfully completed the steps described above, your report will appear in the report editor and you are ready to print your report! If you don't see the report template you just created, please review the Using Plug-In Area section and make sure you have completed the related steps.
8. Select **Print** or **Print Preview** from the **File** menu to print your report. If you don't see any data, you will need to perform Step 5 again to establish a selection. SuperReport Pro does not maintain the selection; you will need to perform this task yourself before you print your reports.

## Creating a Basic Form Report

Next we'll create a slightly more complex report: a form report. Like the listing report we just created, you'll make use of the SuperReport Pro section markers. In addition, we'll introduce a new dialog, the Section Definition dialog.

Using the Section Definition dialog, you can customize the way SuperReport Pro prints your report. In the case of a form report, we don't want the records to print one after another as they were in the listing report. Instead, we want to have each record appear on its own page.

The following steps will outline how to create a form report so that each record is printed on a separate page.

1. Using the SuperReport Pro demo, modify the "Customer Details" report definition (choose **Report Definitions** from the **Demo** menu). This contains a basic form report. Or create your own report, moving the body section down as necessary to create a form report.
2. Double-click on the Body section marker to display the Section Definition dialog:

The screenshot shows the 'SRPro: Section Properties' dialog box with the 'General' tab selected. The 'ID' field is 'section\_07' and the 'Name' field is 'Body'. The 'Lock' dropdown is set to 'Unlocked'. Under 'Section Options', 'Always Use This Section' is selected. Other options include 'Use This Section On The First Page Only', 'Only Use This Section After The First Page', and 'Only Use This Section On Value Changes Of...'. The 'Object' dropdown is set to 'Field' and the 'Name' dropdown is empty. Checkboxes for 'Print This Section On The Report', 'Export this section', and 'Fixed size' are present. Under 'Page Breaking Options', 'Place This Section On The Current Page' is selected. Other options include 'Keep Whole Section On Same Page', 'Start A New Page Before Starting This Section', 'Start A New Page After Completing This Section', and 'Start A New Page If Available Space Is Less Than'. A '0 Inch' input field is visible. 'Cancel' and 'OK' buttons are at the bottom right.

3. Select the **Start A New Page Before Starting This Section** radio button in the **Page Breaking Options** section.
4. Click **OK** to save the change.
5. Now select the **Print Report** or **Print Preview** menu item from the **File** menu to see your new form report. As you can see, each record is printed on a separate page.

## Using Repeating Objects

One of SuperReport Pro's unique features is its ability to print related many records as repeating objects. Using repeating objects, you create your reports in the same fashion as you normally would, placing parent table information in the body section.

With most reporting tools (such as the 4<sup>th</sup> Dimension form editor), if you want to print related many records, you are required to convert your reports to be based on the Many table, then print related one records.

SuperReport Pro provides the ability to include related many records as part of the primary table.

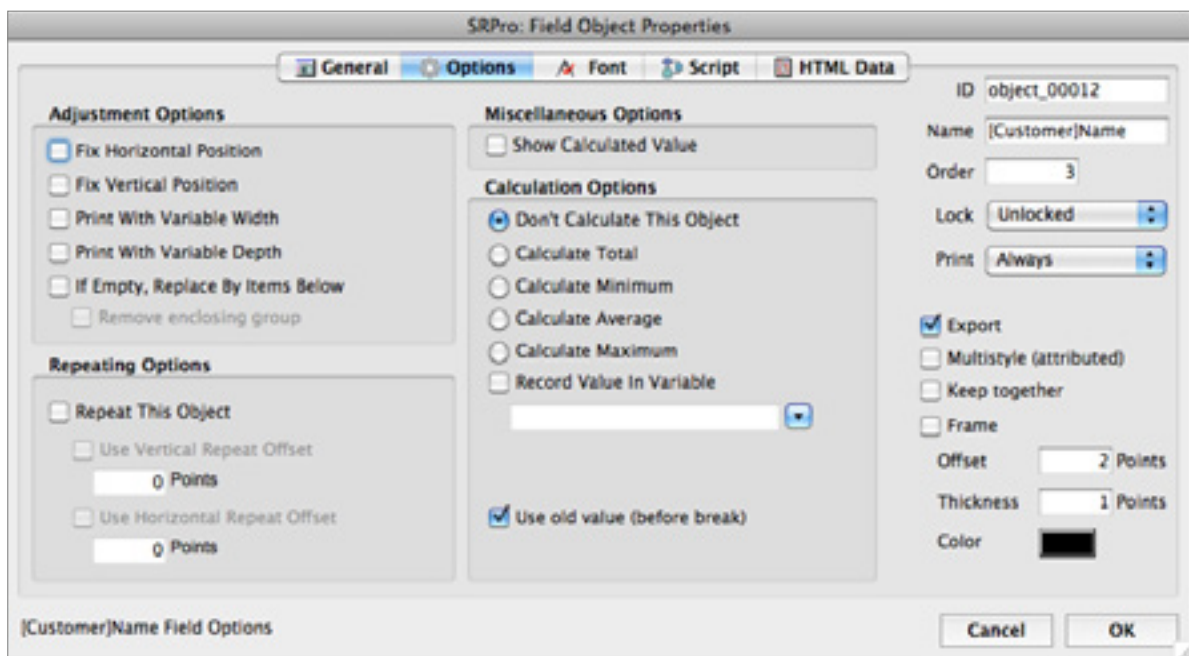

1. Create the report as you normally would, using fields from the parent table (Customer in the Demo database).
2. Next, we'll place the following fields in the Body section – fields from a related many table:

[Invoice]CreateDate

[Invoice]Total

You can apply any type of data formatting you wish to get a feel for what SuperReport Pro has to offer in the way of displaying data.

3. Double-click on the [Invoice]CreateDate field and click the **Options** tab in the Object Properties dialog. The following dialog will be displayed.

Select the **Repeat This Object** check box and click the **Use Vertical Repeat Offset** checkbox, assigning a value of 2 points. This value will be the number of pixels between each repeated object.

4. Do likewise for the **Total** field.
5. The next step is optional depending on the type of table relationship you have set up for the parent and many files.
  - If your file structure is configured to use automatic relations, you don't need to perform any further tasks.
  - If your file structure is configured to use manual relations, you will need to add the following code in the Body section markers scripts so that SuperReport Pro can get the related records at print time.

```
RELATE MANY([Customer])
```

6. Save your report.
7. Now select the **Print Report** or **Print Preview** menu item from the **File** menu. The following example was created using the "Customer Details With Invoice History report" from the Demo database:

## Customer Details With Invoice History

03/04/2014

---

SuperReport Pro Repeating Example Preview

# Creating a Break-Processing Report

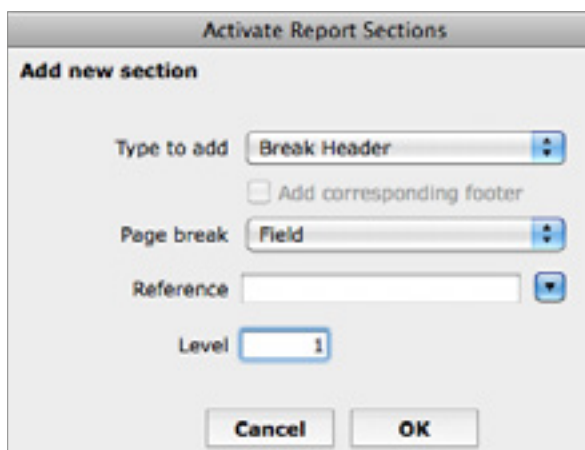

SuperReport Pro provides a very powerful break processing reporting system, providing up to six break levels. Using break processing you could, for example, create a report that prints a list of invoices, sorted by customer.

1. The first step will be to define the main table for the report. Select **Report/Table Iterations** from the Database menu and select **Invoice**:

SuperReport Pro Main Table/Iterations Dialog

2. Click **OK** to save the dialog.
3. The next step will be to set up the sections that we are going to be using on this report. Select **Add Section** from the **Edit** menu. When the Section Definition dialog is displayed, choose **Break Header** from the **Type to Add** popup menu, and leave the **Add Corresponding Footer** option selected:

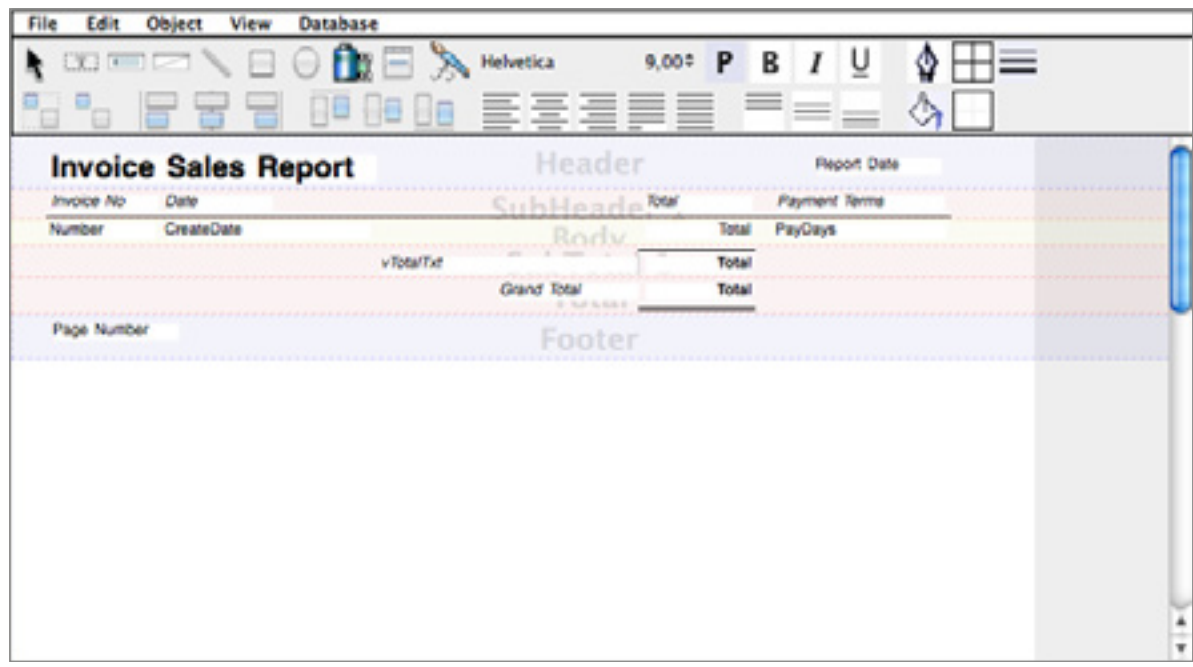

4. Next we'll place the fields and labels in the appropriate sections:

| Section                                | Item                 | Description                            |
|--|----------------------|--|
| Header Section                         | Invoice Sales Report | Static Text Item                       |
|  | Report Date          | Variable                               |
| Break Header 1 Section (field headers) | Invoice No           | Static Text Item                       |
|  | Date                 | Static Text Item                       |
|  | Total                | Static Text Item                       |
| Body Section                           | [Invoice]Number      | Field Object                           |
|  | [Invoice]CreateDate  | Field Object                           |
|  | [Invoice]Total       | Field Object                           |
|  | [Invoice]PayDays     | Field Object                           |
| Break Footer 1 Section (Subtotals)     | Total Line           | Line Object                            |
|  | vTotalTxt            | Variable Object                        |
|  | [Invoice]Total       | Field Object                           |
| Total Section (Report Totals)          | Grand Total          | Static Text Object                     |
|  | [Invoice]Total       | Field Object                           |
|  | Double Lines         | Line Objects (two separate lines)      |
| Footer Section                         | Page Number          | Variable Object (uses SRPage variable) |

Once you have completed adding all the objects, your report should look something like this:

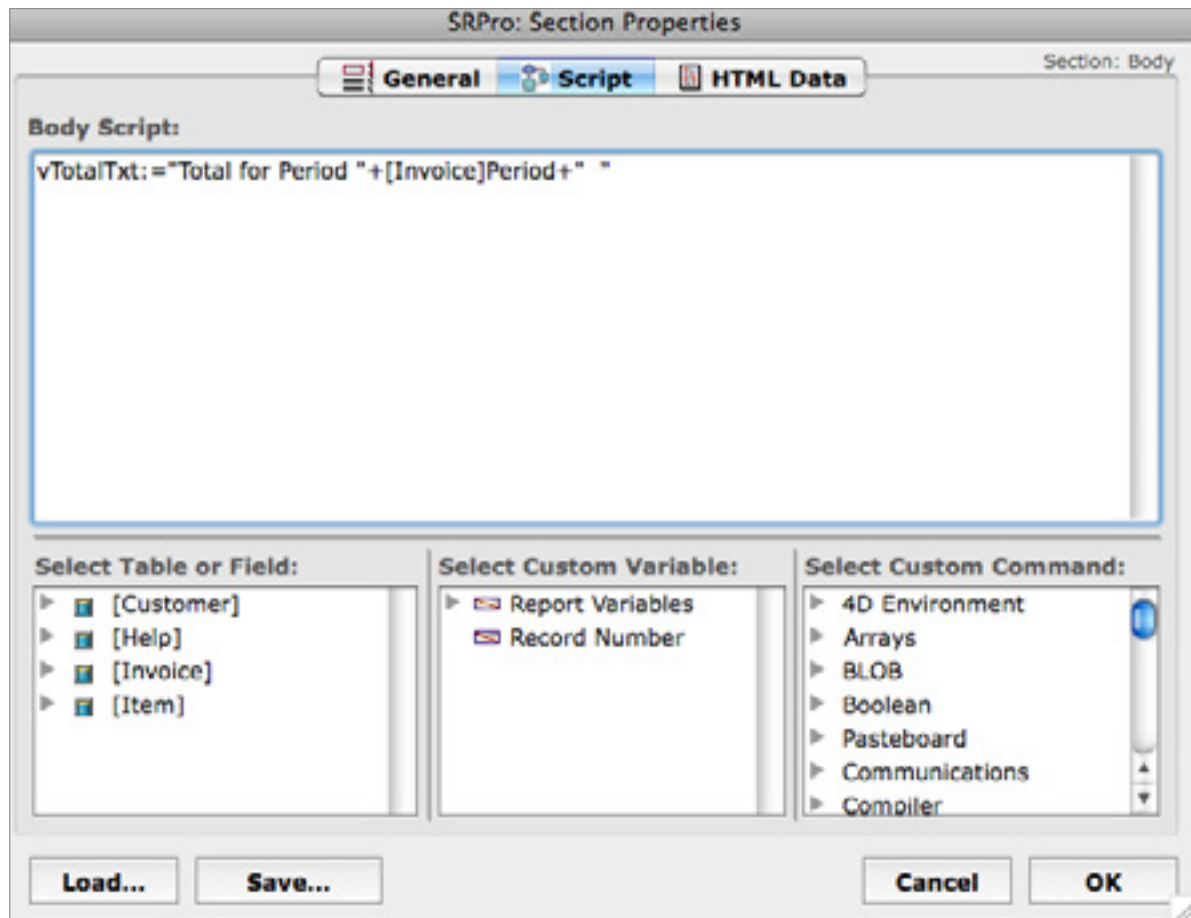

5. The next step will be to configure the "Body" section script to set the vTotalTxt variable located in the Break Footer 1 section. Double-click on the "Body" section marker to display the Section Definition dialog and select the **Script...** tab.

6. Enter the following text, then click the **OK** button to accept the script:

```
vTotalTxt:="Total for Period "+[Invoice]Period+" "
```

Notice that the Body section label now has a shaded corner to indicate that there is a script attached to it:

7. Next, we need to configure the Break Header 1 section so that our break processing occurs correctly. SuperReport Pro calculates the breaks in a report based on one of three items:

- The value of a field for a given table.
- The value of a variable.
- The value of an array element.

In our example, we are going to use the value of a field: the `[Invoice]Period` field.

8. Double-click on the Break Header 1 section to display the Section Definition dialog. You will notice the **Only use this Section on Value Changes Of...** item is enabled (page 1).
  - Select **Only use this Section on Value Changes Of...**
  - Select **Field** from the **Object** popup menu.
  - Select **[Invoice]Period** from the field popup menu.

SRPro: Section Properties

Section: Body

General Script HTML Data

ID: section\_07

Name: Body

Lock: Unlocked

**Section Options**

Always Use This Section

Use This Section On The First Page Only  First Page

Only Use This Section After The First Page  Second Page

Only Use This Section On Value Changes Of...  Last Page  On Top

Keep Whole Section On Same Page  Print at bottom

Place This Section On The Current Page

Start A New Page Before Starting This Section

Start A New Page After Completing This Section

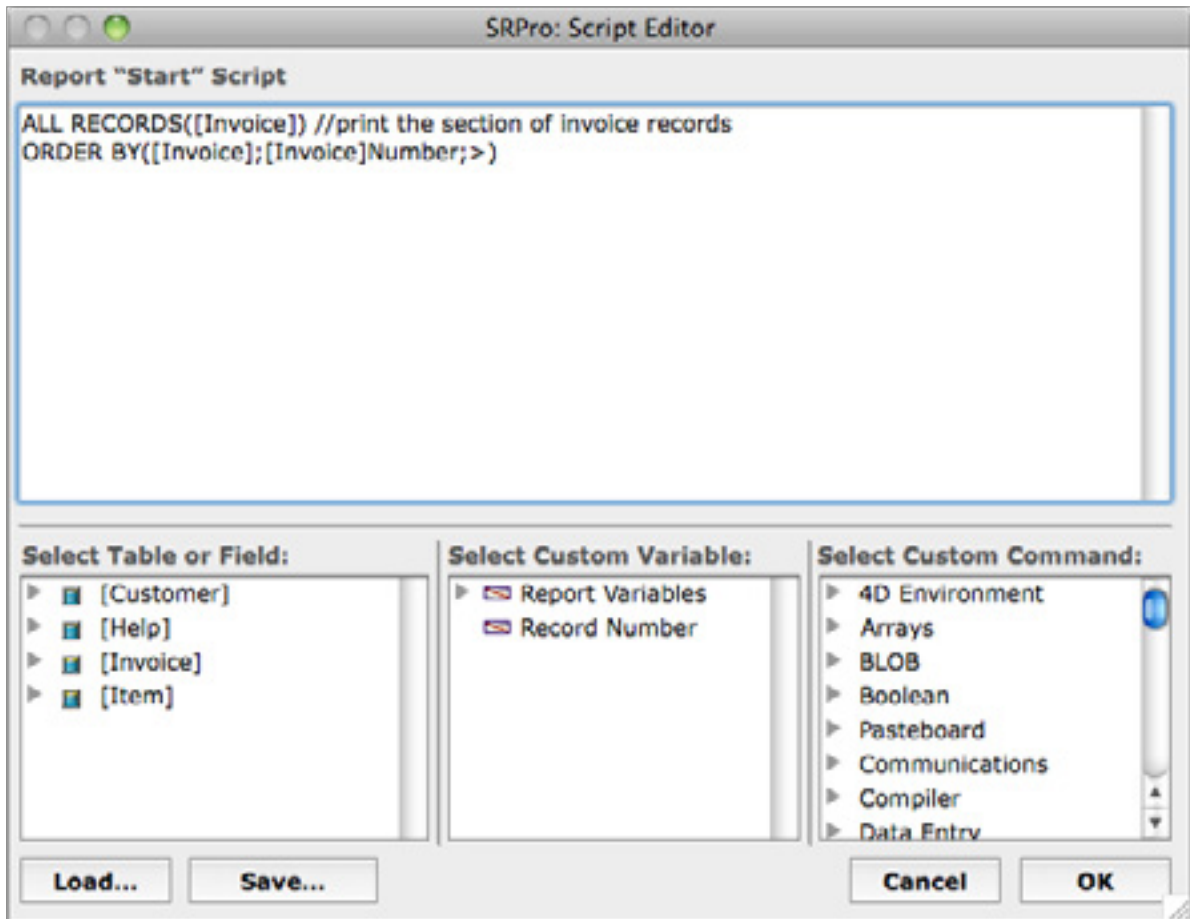

Start A New Page If Available Space Is Less Than 0 Inch

Cancel OK

9. The next step is to establish a selection of records and define a sort order. If you don't sort your selection, SuperReport Pro will not be able to correctly calculate the break, and your report will not appear as expected.
10. Select **Start Script...** from the **Scripts** submenu, located in the **Database** menu. The SuperReport Pro Script Editor will be displayed. (We'll be providing more detail about SuperReport Pro scripts in the next section.)

Enter the following code:

```
ALL RECORDS([Invoice]) // print the selection of invoice records  
ORDER BY([Invoice];[Invoice]Number;>)
```

Start Script Dialog

11. Save your report!

12. Open the report and select **Print Report** or **Print Preview** from the **File** menu to see your report. It should look something like this:

| <b>Invoice Sales Report</b>  |               | 03/04/2014        |                      |
|------------------------------|---------------|-------------------|----------------------|
| <i>Invoice No</i>            | <i>Date</i>   | <i>Total</i>      | <i>Payment Terms</i> |
| 000004                       | 1 janv. 1999  | 2 700,00 €        | Within 30 Days       |
| <i>Total for Period 9901</i> |               | <b>2 700,00 €</b> |                      |

| <i>Invoice No</i>            | <i>Date</i>   | <i>Total</i>      | <i>Payment Terms</i> |

## Creating an HTML Report

SuperReport Pro gives users and developers the ability to include HTML tags in report objects which will be utilized when printing a report using **SR\_Export** or **SR\_ExportIntoBLOB**, or by selecting the HTML option when selecting **Print To Disk** from within the Report Editor.

Each object may contain a standard tag, which is sent before the actual data of the object, and an end tag, which is sent after the object data.

Furthermore, when reports are printed in HTML format, all font attributes are retained and the corresponding font tags are sent automatically when the report is created.

The following steps will convert an existing report (the Basic Listing Report created in the first example) to be suitable for HTML output.

1. Select **Database | Scripts | Start Script** and enter the following code. This will establish some variables which are used within the HTML report, as well as establish a record selection to print.

```
tBegTagHTML:="<html><body bgcolor='#ffffff'>"
```

```
tEndTagHTML:="</body></html>"
```

```
ALL RECORDS([Customer])
```

```
ORDER BY([Customer];[Customer]Code;>)
```

- The next step will be to configure the Header section, which is where you assign the standard HTML header information. In addition to standard HTML tags, we'll introduce the feature of using 4<sup>th</sup> Dimension variables as HTML token variables.

Double-click on the Header object, select the **HTML Data** tab, and enter the following text into the Header HTML Begin Tag field:

```
<%tBegTagHTML%>  
<table border=1 width=100%>
```

#### Header Section | HTML Data

The `<%tBegTagHTML%>` section tells SuperReport Pro to insert the contents of the variable "tBegTagHTML" when this report is printed in HTML format.

The next line will create a standard HTML table to display our data. . Since we are creating a listing style report, using an HTML table is a logical choice.

3. Since we have already created the table creation tag, we'll jump forward a bit to the "Total" section where we place the corresponding `</table>` tag. We place the close table tag in this section as it is where the report will actually end when the corresponding section completes printing.

Double-click on the Total section marker, click on the **HTML Data** tab, and enter the following HTML tag in the Begin section:

```
</table>
```

If you were to create a break processing report where you had multiple sections, you could create nested tables by place the `<table>` tag in the SubHeader section, and the `</table>` tag in the corresponding SubTotal section.

- The next step will be to insert the new row tags (<tr> and </tr>). The Body script is executed for each record in the current selection and it executes before the body section's object scripts.

Double-click on the Body section marker, click on the **HTML Data** tab, and enter the following HTML tags.

Begin Tag: <tr>

End Tag: </tr>

- Now that we have successfully created our tables, it is now time to add some data cells. Using the HTML <td> and </td> tags, we can create table cells for the current row.

For each field in the Body section, double-click on the field object, click on the **HTML Data** tab and add the following tags:

Begin Tag: <td>

End Tag: </td>

As each object in the body section is printed, a new cell will be created.

- The last piece of the body data will be to create a row for the data blocks in the header section. Since the scripts of these objects are executed after the header marker, we can create the first row of column data before the corresponding body section is executed.

For each object in the Header section which is a column title, double-click on the object, select the **HTML Data** tab, and add the following tags:

Begin Tag: <td><b>

End Tag: </b></td>

These tags will create a single row containing the column headings, applying the bold HTML tag. You will notice that the End Tag section has the `</b>` tag before the `</td>` tag. As outlined in the first step, the Begin Tag is sent to the HTML file before the data is sent, the data is sent, and then the end tag is sent. If you were to place the `</b>` tag after the `</td>` tag, the generated HTML file would be incorrect.

7. The final configuration item will be to close our HTML file. Since we placed the beginning HTML tags in the report's Header section marker, the logical place to place the closing HTML tags is in the Footer section.

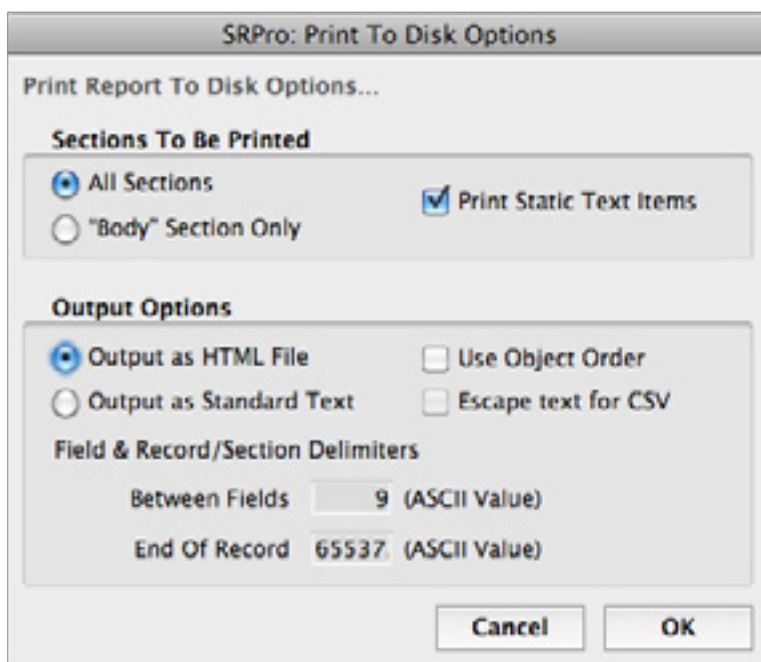

Double-click on the Footer section marker, click on the **HTML Data** tab, and enter the following code:

```
<%tEndTagHTML%>
```

Like the HTML header, the end tag is using a custom 4<sup>th</sup> Dimension variable to hold the standard end tag data.

8. Now we are ready to create our HTML file, using the **SR\_Export** command or by selecting **Export...** from the **File** menu and selecting the **Output As HTML** option in the **Output Options** section.

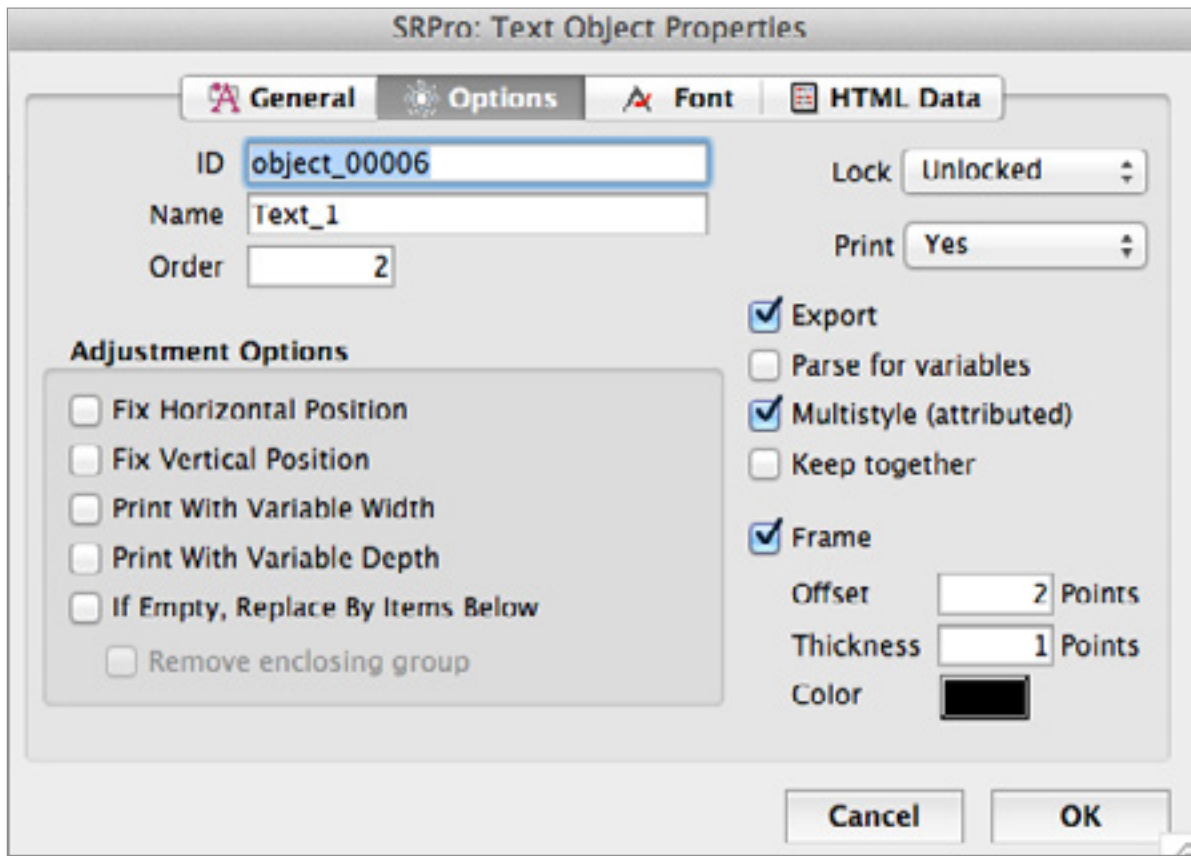

When exporting using HTML output, remember to select the **Print Static Text Items** option and **All Sections**, otherwise your HTML data will be incomplete.

# Styled (attributed) text

Multistyled text (a.k.a. “attributed”) can be printed in the various object types: variables, text, fields, table headers and table columns. This feature is activated in the object Options tab, **Multistyle** checkbox.

- Make the text multistyled (attributed):

- Add attributes to modify the style using simple tags: a list of supported tags can be found in the [SuperReport Pro Developer Reference](#) (see “SuperReport Pro Text Style Tags”):

- Then the word "bold" is actually bold:

Note: if you want to use variables in the otherwise static text (**Parse for variables** is checked), you have to encode special characters (instead of using <%variable%> you must use &lt;variable&gt;).

# Printing Arrays

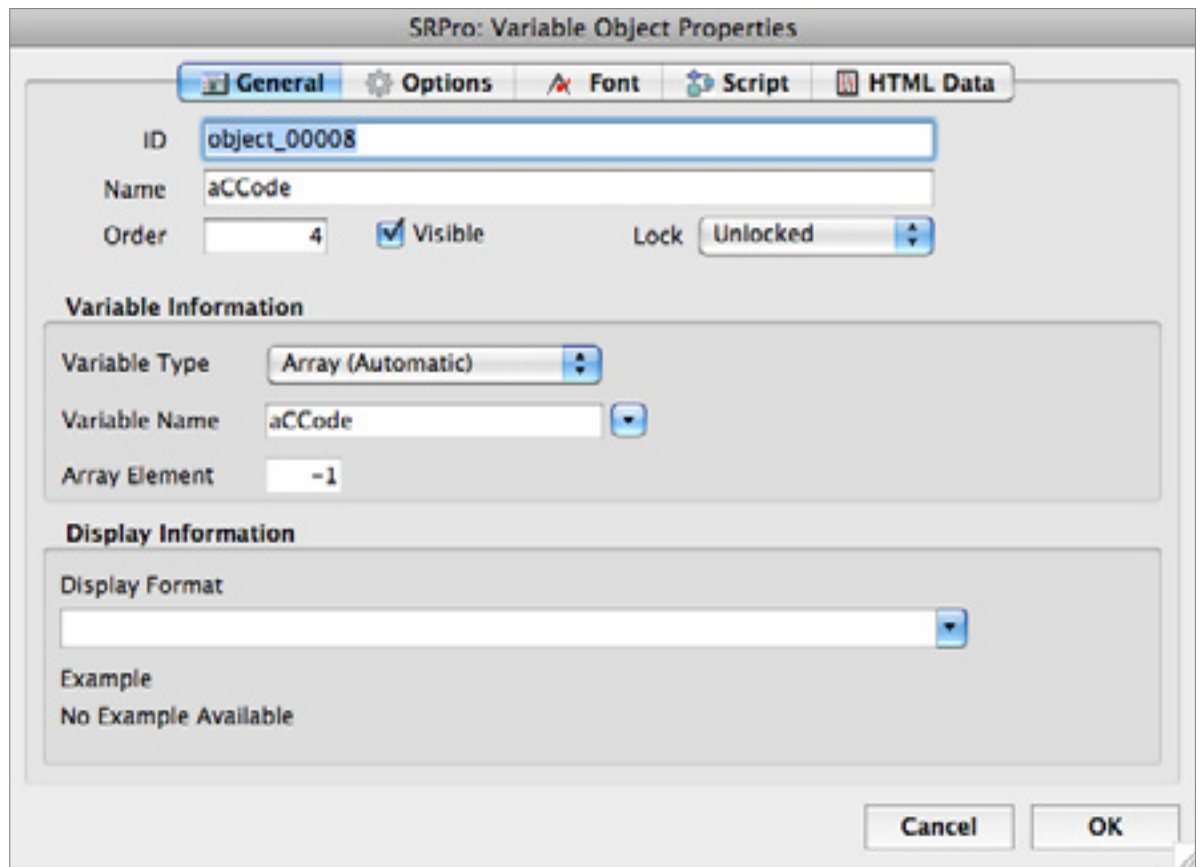

While SuperReport Pro provides an extensive feature set for printing 4<sup>th</sup> Dimension database fields, we didn't stop there! SuperReport Pro can also print 4<sup>th</sup> Dimension arrays, whether it be a full array (all elements in the array), or a specific array element — SuperReport Pro can handle it!

The following tutorial will teach you how to create a SuperReport Pro report for printing a group of arrays. In addition, we'll discuss how to configure the Report Table/Iterations dialog to use the array size instead of the number of records in a selection as we have in previous examples.

Using the Customer Listing report we created in the first example as a template, perform the following tasks.

- 1. Replace all field reference objects with new variable objects.

Click on the variable tool in the SuperReport Pro Editor Toolbar, draw a box in the same location as the original [Customer]Code field, and assign a variable name of aCCode (for Customer Code) and select the Variable Type to be Array (Automatic).

Array Variable Object

2. Repeat Step 1 for each of the following variable names

- aCName Customer Name
- aCTel Customer Phone
- aCFax Customer Fax

Your report should now look something like this:

| Customer List |        |           |       | Report Date |
|---------------|--------|-----------|-------|-------------|
| Code          | Name   | Telephone | Fax   |             |
| Header        | aCName | aCTel     | aCFax |             |
| Body          |        |           |       |             |
| Total         |        |           |       | Page Number |
| Footer        |        |           |       |             |

Sample Array Report

3. The next step is to define the report iterations based on the size of the array we are printing. Since all the arrays will be of equal size, we can select any of the arrays to define the report iterations.

Select **Report Table/Iterations** from the **Database** menu. When the dialog is displayed, select the **Use Size Of Array** radio button and use the aCCode array.

SRPro: Main Table/Iterations

Selected Report Table

- Customer
- Invoice
- Item

Fixed Number Of Iterations  
Value: -1

Use Value In Variable  
Name: \_\_\_\_\_

Use Size Of Array  
Name: aCCode

Cancel OK

Report Iterations based on array size

4. The last step is to create the arrays.

Select **Start Script** from the **Scripts** submenu, located in the **Database** menu.

Enter the following code and save the script:

```
ALL RECORDS([Customer])
SELECTION TO ARRAY ([Customer]Code;aCCode;[Customer]Name;aCName;[Customer]Telephone;aCTel)
SORT ARRAY(aCCode;aCName;aCTel;>)
```

5. Save your report, then re-open it.
6. Select **Print Preview** or **Print** from the **File** menu to see your report.

# 3 Hints and Tips

Feel free to extract this chapter (courtesy of [Gallery Systems](#)) and distribute it to your users. You are also welcome to enhance it: send us any improvement that you'd like to include!

The SuperReport Pro advanced reporting tool has been completely rewritten and has significant new functionality. Legacy report templates will automatically convert to the new format.

Note: once converted, the reports can no longer be used with the old version, so be sure to make backups.

The following list covers some of the new functionalities.

- 1. Templates** are stored in XML format. Previously, templates were required to have a .SRP file extension. While .SRP is still supported, the new default is .XML. It is now possible to open the XML template files with a text editor.
- 2. Preview** opens in PDF format on Macintosh and XPS format on Windows. While PDF is a default system configuration on all Macintosh machines, the new XPS format may not be configured on Windows workstations. More information about downloading the viewer is available [here](#). If XPS Viewer is already installed on your system but not set as the default for viewing XPS files, it may be necessary to adjust the default viewer for this file type in Control Panels.
- 3. Support for Columns:** SuperReport Pro version 3 supports columns, so legacy templates that used the **NEXT RECORD** scripting command may be updated. Records may be set to print vertically (down the page) or horizontally (across the page). To adjust a template, open it and then choose **Report Options** from the **Edit** menu. Note however that the old behavior is supported: reports using **NEXT RECORD** will still work.
- 4. Multi-Style Text:** this new setting should be applied for any Object Notes fields or Report Text where the new rich text functionality has been enabled.
- 5. Selecting Objects:** hold Opt/Alt to select groups of objects with just a touch. This mimics the previous behavior of the old versions of SuperReport Pro. Otherwise, you must drop a complete box around the report object to select it. You can also use the menu: **Edit > Select Objects**.
- 6. Cursor Control:** want to move selected items a bit more quickly? By default, if you select an item (so that it has corner squares), then use the keyboard arrows to adjust the position, it will only move 1 point at a time. Go to the **Edit** menu and choose **Report Options**, then adjust the **Arrows Move By** value to anything from 0.1 to 5 (5 is fastest). Use Shift + arrow keys to move by 10 times the preset value.
- 7. Grouping** allows elements to be associated. For example, it might be useful to group the text box for a field label with the field/variable data it describes. Select both objects and then choose **Group** from the **Object** menu.
- 8. Locking:** individual elements on a template may now be set as **Unlocked**, **Locked** (selectable), and **Fully Locked** (not selectable). These options may also be applied for entire report sections (such as the Body or Footer). Essentially, when an element is Locked, it can not be moved with the cursor (preventing undesired changes).

9. **Zooming in Design View:** having trouble seeing the little boxes on the report editor? Choose **Zoom In** from the **View** menu.
10. **Embed HTML styles into Text objects.** E.g. "Some <b>Bold</b> text". Be sure to click the **Multistyle (attributed)** checkbox on the **Options** tab.
11. **Line Spacing (Leading):** if a field has wrapped multi-line text, you can adjust the spacing between lines. Double-click the object and go to the **Font** tab and enter a value such as ".5" to bring lines closer together or "2" to double-space. Or use the menu: **Object > Increase Line Spacing / Object > Decrease Line Spacing**.
12. **Rotation:** need to print text on its side? Double-click the object and go to the **Font** tab. Adjust the rotation value to any number between 1 and 360 (or leave at None).
13. **Framing:** each report object can be configured to have a frame (border). Double-click the object and go to the **Options** tab. Click the checkbox for **Frame**. **Offset** allows for the control of the amount of white space between the data and the frame. **Thickness** allows for control of the weight of the frame. **Color** provides a pop-up picker to choose the color of the frame. If the object is of variable size, it is best to draw it at a smaller size and then set the **Print with Variable Width** and/or **Print with Variable Depth** boxes (also on the **Options** tab) so that the object and its frame grow dynamically.
14. **Adjust Object Size by Style:** when a report element (box) is drawn, it may be any size. The command in the **Object** menu called **Adjust Object Size by Style** will adjust the size of the object according to the font size and style selected. If the field uses the Multistyle option, the size cannot be adjusted because each record could have text of variable size.
15. **Sections:** when sections are adjusted (by clicking on the line that says Header or Body, for example), the contents of the other sections move along with them automatically.
16. **Multiple Header and Footer Sections:** it is now possible to create up to 3 instances of the Header section. One might be set to print on the First Page Only, another for the 2<sup>nd</sup> (and other middle pages) and the third for the Last Page Only. Sub-headers are now called Break headers. The Total section is now called Break footer. Note that for the Last Page to work, you need to check the option **Calculate number of pages** in the **Edit > Report Options** dialog. Otherwise the last page header/footer will be never printed.
17. **Watermarking:** go to the **Edit** menu and choose the **Add Section** command. Select **Watermark** from the popup list. By default, it is set as the topmost layer so that can be edited. Once a watermark image is in place, uncheck the **On Top** setting. To modify the watermark section, choose **Modify Sections** from the **Edit** menu and select **Watermark**. Check the **On Top** box to edit.
18. **Show Object Content:** go the **View** menu and choose **Object Content**. It is now possible to see an assortment of useful values - including a preview of the data from the record (such as the Display Title or Thumbnail).
19. **Insert Picture:** go to the Toolbar and select the icon that looks like a roll of film. This will allow you to draw a Picture Object box (perhaps for a logo graphic). Right-click the picture box on the **Properties** window to Paste an image or select **Import...** to browse to a file (or even use drag-and-drop!). Various properties such as Frame settings may be assigned.
20. **Tables:** the Toolbar icon to the right of the **Insert Picture** icon is the **Table Tool**. [This tool](#) offers a tremendous amount of functionality. Tables offer a great solution for printing Object-related content. With the older versions, fields from these tables could be drawn on the report and set to Repeat. However the repeating fields had to be set with a fixed Repeat Offset - so fields with varying length of content might get cut-off (or show too much white space). The Table Tool has a **Calculate Height** option that can automatically calculate the varying data height required to display content. Note that there may be some limitations with the ability to use variables and apply advanced scripting.

- 21. Styles Popup Tool:** another Toolbar icon allows you to create saved styles. For example, you can create a style called "Headers" that would be defined as Arial Font - Size 24 - Bold. Select an object, then click the **Styles** Popup to automatically set it with all of these properties.
- 22. Page count:** you can now calculate the number of pages in the report via **Edit > Report Options** in order to add a footer like "Page 1 of 9". It will fully process the report to get the count, and then process it a second time (which may be awkward for reports that include alerts or prompts in the scripts).
- 23. No 80 character limit on text fields:** as AlphaNumeric fields in 4D increased from 80 characters to a maximum of 255, the old report writer could only print 80 characters unless the field was assigned to a variable. This workaround is no longer required.
- 24. Setting Print Order:** the Print Order of objects on the report is especially important when exporting the data in a report to a text file. In the previous version of SuperReport Pro, the only way to reset the order was to use the tedious **Send to Back** command. With SuperReport Pro version 3, a new command in the **Object** menu allows for selected objects to be **Reordered by Position**. You can even choose to **Reverse Order**. Additionally, by opening the **Properties** window for any object, you will find an **Order** field on the **Options** tab. Additional options allow you to specify if the Object should be Printed or Exported at all.
